At this point, the state of the heap is uncertain, because malloc is still modifying the metadata for the heap; the metadata might be in an inconsistent state. The SIGTERM-handler call to free() is assuming that the metadata is inconsistent, possibly causing it to write data to the wrong location while managing the heap. The result is memory corruption, which could lead to a crash or even code execution, depending on the circumstances under which the code is running.

Note that this is an adaptation of a classic example as originally presented by Michal Zalewski [REF-360]; the original example was shown to be exploitable for code execution.

Also note that the strdup(argv[1]) call contains a potential buffer over-read (CWE-126) if the program is called without any arguments, because argc would be 0, and argv[1] would point outside the bounds of the array.

## CWE-832: Unlock of a Resource that is not Locked

**Weakness ID** : 832

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software attempts to unlock a resource that is not locked.

### Extended Description

Depending on the locking functionality, an unlock of a non-locked resource might cause memory corruption or other modification to the resource (or its associated metadata that is used for tracking locks).

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	ⓑ	667	Improper Locking	1300

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf	ⓑ	667	Improper Locking	1300

### Common Consequences

Scope	Impact	Likelihood
Integrity	DoS: Crash, Exit, or Restart	
Confidentiality	Execute Unauthorized Code or Commands	
Availability	Modify Memory	
Other	Other	
<p><i>Depending on the locking being used, an unlock operation might not have any adverse effects. When effects exist, the most common consequence will be a corruption of the state of the software, possibly leading to a crash or exit; depending on the implementation of the unlocking, memory corruption or code execution could occur.</i></p>		

### Observed Examples

Reference	Description
<b>CVE-2010-4210</b>	function in OS kernel unlocks a mutex that was not previously locked, causing a panic or overwrite of arbitrary memory. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-4210">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-4210</a>
<b>CVE-2008-4302</b>	Chain: OS kernel does not properly handle a failure of a function call (CWE-755), leading to an unlock of a resource that was not locked (CWE-832), with resultant crash. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4302">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4302</a>
<b>CVE-2009-1243</b>	OS kernel performs an unlock in some incorrect circumstances, leading to panic. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1243">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1243</a>

## CWE-833: Deadlock

<b>Weakness ID</b> : 833	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains multiple threads or executable segments that are waiting for each other to release a necessary lock, resulting in deadlock.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		667	Improper Locking	1300

*Relevant to the view "Development Concepts" (CWE-699)*

## CWE-834: Excessive Iteration

**Weakness ID** : 834

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software performs an iteration or loop without sufficiently limiting the number of times that the loop is executed.

### Extended Description

If the iteration can be influenced by an attacker, this weakness could allow attackers to consume excessive resources such as CPU or memory. In many cases, a loop does not need to be infinite in order to cause enough resource consumption to adversely affect the software or its host system; it depends on the amount of resources consumed per iteration.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		691	Insufficient Control Flow Management	1342

CanFollow		606	Unchecked Input for Loop Condition	1206

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		438	Behavioral Problems	1747
ParentOf		835	Loop with Unreachable Exit Condition ('Infinite Loop')	1543

## Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (CPU) DoS: Resource Consumption (Memory) DoS: Amplification DoS: Crash, Exit, or Restart  <i>Excessive looping will cause unexpected consumption of resources, such as CPU cycles or memory. The software's operation may slow down, or cause a long time to respond. If limited resources such as memory are consumed for each iteration, the loop may eventually cause a crash or program exit due to exhaustion of resources, such as an out-of-memory error.</i>	

## Detection Methods

### Dynamic Analysis with Manual Results Interpretation

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Fuzz Tester Framework-based Fuzzer Forced Path Execution

*Effectiveness = SOAR Partial*

### Manual Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Focused Manual Spotcheck - Focused manual analysis of source Manual Source Code Review (not inspections)

*Effectiveness = SOAR Partial*

### Automated Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Highly cost effective: Context-configured Source Code Weakness Analyzer

*Effectiveness = High*

### Architecture or Design Review

According to SOAR, the following detection techniques may be useful: Highly cost effective: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.)

*Effectiveness = High*

## CWE-835: Loop with Unreachable Exit Condition ('Infinite Loop')

**Weakness ID** : 835

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

## Description

The program contains an iteration or loop with an exit condition that cannot be reached, i.e., an infinite loop.

## Extended Description

If the loop can be influenced by an attacker, this weakness could allow attackers to consume excessive resources such as CPU or memory.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

ChildOf	⊖	834	Excessive Iteration	1542

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf	⊖	834	Excessive Iteration	1542

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (CPU) DoS: Resource Consumption (Memory) DoS: Amplification  <i>An infinite loop will cause unexpected consumption of resources, such as CPU cycles or memory. The software's operation may slow down, or cause a long time to respond.</i>	

## Demonstrative Examples

### Example 1:

In the following code the method processMessagesFromServer attempts to establish a connection to a server and read and process messages from the server. The method uses a do/while loop to continue trying to establish the connection to the server when an attempt fails.

*Example Language: C*

*(bad)*

```
int processMessagesFromServer(char *hostaddr, int port) {
    ...
    int servsock;
    int connected;
    struct sockaddr_in servaddr;
    // create socket to connect to server
    servsock = socket( AF_INET, SOCK_STREAM, 0);
    memset( &servaddr, 0, sizeof(servaddr));
    servaddr.sin_family = AF_INET;
    servaddr.sin_port = htons(port);
    servaddr.sin_addr.s_addr = inet_addr(hostaddr);
    do {
        // establish connection to server
        connected = connect(servsock, (struct sockaddr *)&servaddr, sizeof(servaddr));
        // if connected then read and process messages from server
        if (connected > -1) {
            // read and process messages
            ...
        }
        // keep trying to establish connection to the server
    } while (connected < 0);
    // close socket and return success or failure
    ...
}
```

}

However, this will create an infinite loop if the server does not respond. This infinite loop will consume system resources and can be used to create a denial of service attack. To resolve this a counter should be used to limit the number of attempts to establish a connection to the server, as in the following code.

Example Language: C

(good)

```
int processMessagesFromServer(char *hostaddr, int port) {
    ...
    // initialize number of attempts counter
    int count = 0;
    do {
        // establish connection to server
        connected = connect(servsock, (struct sockaddr *)&servaddr, sizeof(servaddr));
        // increment counter
        count++;
        // if connected then read and process messages from server
        if (connected > -1) {
            // read and process messages
            ...
        }
        // keep trying to establish connection to the server
        // up to a maximum number of attempts
    } while (connected < 0 && count < MAX_ATTEMPTS);
    // close socket and return success or failure
    ...
}
```

### Example 2:

For this example the method `isReorderNeeded` as part of a bookstore application that determines if a particular book needs to be reordered based on the current inventory count and the rate at which the book is being sold.

Example Language: Java

(bad)

```
public boolean isReorderNeeded(String bookISBN, int rateSold) {
    boolean isReorder = false;
    int minimumCount = 10;
    int days = 0;
    // get inventory count for book
    int inventoryCount = inventory.getInventoryCount(bookISBN);
    // find number of days until inventory count reaches minimum
    while (inventoryCount > minimumCount) {
        inventoryCount = inventoryCount - rateSold;
        days++;
    }
    // if number of days within reorder timeframe
    // set reorder return boolean to true
    if (days > 0 && days < 5) {
        isReorder = true;
    }
    return isReorder;
}
```

However, the while loop will become an infinite loop if the `rateSold` input parameter has a value of zero since the `inventoryCount` will never fall below the `minimumCount`. In this case the input parameter should be validated to ensure that a value of zero does not cause an infinite loop, as in the following code.

Example Language: Java

(good)

```
public boolean isReorderNeeded(String bookISBN, int rateSold) {
```

```

...
// validate rateSold variable
if (rateSold < 1) {
    return isReorder;
}
...
}

```

### Observed Examples

## CWE-836: Use of Password Hash Instead of Password for Authentication

**Weakness ID** : 836

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software records password hashes in a data store, receives a hash of a password from a client, and compares the supplied hash to the hash obtained from the data store.

## Extended Description

Some authentication mechanisms rely on the client to generate the hash for a password, possibly to reduce load on the server or avoid sending the password across the network. However, when the client is used to generate the hash, an attacker can bypass the authentication by obtaining a copy of the hash, e.g. by using SQL injection to compromise a database of authentication credentials, or by exploiting an information exposure. The attacker could then use a modified client to replay the stolen hash without having knowledge of the original password.

As a result, the server-side comparison against a client-side hash does not provide any more security than the use of passwords without hashing.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism Gain Privileges or Assume Identity  <i>An attacker could bypass the authentication routine without knowing the original password.</i>	

## Observed Examples

Reference	Description
<b>CVE-2009-1283</b>	Product performs authentication with user-supplied password hashes that can be obtained from a separate SQL injection vulnerability (CVE-2009-1282). <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1283">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1283</a>
<b>CVE-2005-3435</b>	Product allows attackers to bypass authentication by obtaining the password hash for another user and specifying the hash in the pwd argument. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3435">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3435</a>

## CWE-837: Improper Enforcement of a Single, Unique Action

**Weakness ID** : 837

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base**Description**

The software requires that an actor should only be able to perform an action once, or to have only one unique action, but the software does not enforce or improperly enforces this restriction.

**Extended Description**

In various applications, a user is only expected to perform a certain action once, such as voting, requesting a refund, or making a purchase. When this restriction is not enforced, sometimes this can have security implications. For example, in a voting application, an attacker could attempt to "stuff the ballot box" by voting multiple times. If these votes are counted separately, then the attacker could directly affect who wins the vote. This could have significant business impact depending on the purpose of the software.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

<b>CVE-2002-216</b>	Polling software allows people to vote more than once by setting a cookie. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-216">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-216</a>
<b>CVE-2003-1433</b>	Chain: lack of validation of a challenge key in a game allows a player to register multiple times and lock other players out of the game. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-1433">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-1433</a>
<b>CVE-2002-1018</b>	Library feature allows attackers to check out the same e-book multiple times, preventing other users from accessing copies of the e-book. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1018">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1018</a>
<b>CVE-2009-2346</b>	Protocol implementation allows remote attackers to cause a denial of service (call-number exhaustion) by initiating many message exchanges. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2346">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2346</a>

## CWE-838: Inappropriate Encoding for Output Context

**Weakness ID** : 838  
**Structure** : Simple  
**Abstraction** : Base

**Status**: Incomplete

### Description

The software uses or specifies an encoding when generating output to a downstream component, but the specified encoding is not the same as the encoding that is expected by the downstream component.

### Extended Description

This weakness can cause the downstream component to use a decoding method that produces different data than what the software intended to send. When the wrong encoding is used - even if closely related - the downstream component could decode the data incorrectly. This can have security consequences when the provided boundaries between control and data are inadvertently broken, because the resulting data could introduce control characters or special elements that were not sent by the software. The resulting data could then be used to bypass protection mechanisms such as input validation, and enable injection attacks.

While using output encoding is essential for ensuring that communications between components are accurate, the use of the wrong encoding - even if closely related - could cause the downstream component to misinterpret the output.

For example, HTML entity encoding is used for elements in the HTML body of a web page. However, a programmer might use entity encoding when generating output for that is used within an attribute of an HTML tag, which could contain functional Javascript that is not affected by the HTML encoding.

While web applications have received the most attention for this problem, this weakness could potentially apply to any type of software that uses a communications stream that could support multiple encodings.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		116	Improper Encoding or Escaping of Output	265

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		116	Improper Encoding or Escaping of Output	265

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Integrity	Modify Application Data	
Confidentiality	Execute Unauthorized Code or Commands	
Availability		

Scope	Impact	Likelihood
	An attacker could modify the structure of the message or data being sent to the downstream component, possibly injecting commands.	

## Potential Mitigations

### Phase: Implementation

*Strategy = Output Encoding*

Use context-aware encoding. That is, understand which encoding is being used by the downstream component, and ensure that this encoding is used. If an encoding can be specified, do so, instead of assuming that the default encoding is the same as the default being assumed by the downstream component.

### Phase: Architecture and Design

*Strategy = Output Encoding*

Where possible, use communications protocols or data formats that provide strict boundaries between control and data. If this is not feasible, ensure that the protocols or formats allow the communicating components to explicitly state which encoding/decoding method is being used. Some template frameworks provide built-in support.

### Phase: Architecture and Design

*Strategy = Libraries or Frameworks*

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. For example, consider using the ESAPI Encoding control [REF-45] or a similar tool, library, or framework. These will help the programmer encode outputs in a manner less prone to error. Note that some template mechanisms provide built-in support for the appropriate encoding.

## Demonstrative Examples

### Example 1:

This code dynamically builds an HTML page using POST data:

*Example Language: PHP*

*(bad)*

```
$username = $_POST['username'];
$picSource = $_POST['picsource'];
$picAltText = $_POST['picalttext'];
...
echo "<title>Welcome, " . htmlentities($username) . "</title>";
echo "<img src=\"". htmlentities($picSource) . "\" alt=\"". htmlentities($picAltText) . "\" />";
...
```

The programmer attempts to avoid XSS exploits (CWE-79) by encoding the POST values so they will not be interpreted as valid HTML. However, the htmlentities() encoding is not appropriate when the data are used as HTML attributes, allowing more attributes to be injected.

For example, an attacker can set picAltText to:

*Example Language:*

*(attack)*

```
"altTextHere' onload='alert(document.cookie)"
```

This will result in the generated HTML image tag:

*Example Language: HTML*

*(result)*

```
<img src='pic.jpg' alt='altTextHere' onload='alert(document.cookie)' />
```

The attacker can inject arbitrary javascript into the tag due to this incorrect encoding.

### Observed Examples

Reference	Description
<b>CVE-2009-2814</b>	Server does not properly handle requests that do not contain UTF-8 data; browser assumes UTF-8, allowing XSS. <i><a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2814">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2814</a></i>

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

## CWE-839: Numeric Range Comparison Without Minimum Check

Weakness ID : 839

Status: Incomplete

Structure : Simple

Abstraction : Base

## Description

The program checks a value to ensure that it is less than or equal to a maximum, but it does not also verify that the value is greater than or equal to the minimum.

## Extended Description

Some programs use signed integers or floats even when their values are only expected to be positive or 0. An input validation check might assume that the value is positive, and only check for the maximum value. If the value is negative, but the code assumes that the value is positive, this can produce an error. The error may have security consequences if the negative value is used for memory allocation, array access, buffer access, etc. Ultimately, the error could lead to a buffer overflow or other type of memory corruption.

The use of a negative number in a positive-only context could have security implications for other types of resources. For example, a shopping cart might check that the user is not requesting more than 10 items, but a request for -3 items could cause the application to calculate a negative price and credit the attacker's account.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		1023	Incomplete Comparison with Missing Factors	1633
CanPrecede		119	Improper Restriction of Operations within the Bounds of a Memory Buffer	276
CanPrecede		124	Buffer Underwrite ('Buffer Underflow')	304
CanPrecede		195	Signed to Unsigned Conversion Error	464
CanPrecede		682	Incorrect Calculation	1325

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		189	Numeric Errors	1732

## Applicable Platforms

**Language** : C (Prevalence = Often)

**Language** : C++ (Prevalence = Often)

## Alternate Terms

**Signed comparison** : The "signed comparison" term is often used to describe when the program uses a signed variable and checks it to ensure that it is less than a maximum value (typically a maximum buffer size), but does not verify that it is greater than 0.

## Common Consequences

Scope	Impact	Likelihood
Integrity	Modify Application Data	
Confidentiality	Execute Unauthorized Code or Commands	
Availability		

Scope	Impact	Likelihood
	<i>An attacker could modify the structure of the message or data being sent to the downstream component, possibly injecting commands.</i>	
Availability	DoS: Resource Consumption (Other) <i>in some contexts, a negative value could lead to resource consumption.</i>	
Confidentiality Integrity	Modify Memory Read Memory  <i>If a negative value is used to access memory, buffers, or other indexable structures, it could access memory outside the bounds of the buffer.</i>	

### Potential Mitigations

#### Phase: Implementation

*Strategy = Enforcement by Conversion*

If the number to be used is always expected to be positive, change the variable type from signed to unsigned or size\_t.

#### Phase: Implementation

*Strategy = Input Validation*

If the number to be used could have a negative value based on the specification (thus requiring a signed value), but the number should only be positive to preserve code correctness, then include a check to ensure that the value is positive.

### Demonstrative Examples

#### Example 1:

The following code is intended to read an incoming packet from a socket and extract one or more headers.

*Example Language: C*

*(bad)*

```
DataPacket *packet;
int numHeaders;
PacketHeader *headers;
sock=AcceptSocketConnection();
ReadPacket(packet, sock);
numHeaders =packet->headers;
if (numHeaders > 100) {
    ExitError("too many headers!");
}
headers = malloc(numHeaders * sizeof(PacketHeader));
ParsePacketHeaders(packet, headers);
```

The code performs a check to make sure that the packet does not contain too many headers. However, numHeaders is defined as a signed int, so it could be negative. If the incoming packet specifies a value such as -3, then the malloc calculation will generate a negative number (say, -300 if each header can be a maximum of 100 bytes). When this result is provided to malloc(), it is first converted to a size\_t type. This conversion then produces a large value such as 4294966996, which may cause malloc() to fail or to allocate an extremely large amount of memory (CWE-195). With the appropriate negative numbers, an attacker could trick malloc() into using a very small positive number, which then allocates a buffer that is much smaller than expected, potentially leading to a buffer overflow.

#### Example 2:

The following code reads a maximum size and performs a sanity check on that size. It then performs a strncpy, assuming it will not exceed the boundaries of the array. While the use of "short s" is forced in this particular example, short int's are frequently used within real-world code, such as code that processes structured data.

Example Language: C

(bad)

```
int GetUntrustedInt () {
    return(0x0000FFFF);
}
void main (int argc, char **argv) {
    char path[256];
    char *input;
    int i;
    short s;
    unsigned int sz;
    i = GetUntrustedInt();
    s = i;
    /* s is -1 so it passes the safety check - CWE-697 */
    if (s > 256) {
        DiePainfully("go away!\n");
    }
    /* s is sign-extended and saved in sz */
    sz = s;
    /* output: i=65535, s=-1, sz=4294967295 - your mileage may vary */
    printf("i=%d, s=%d, sz=%u\n", i, s, sz);
    input = GetUserInput("Enter pathname:");
    /* strncpy interprets s as unsigned int, so it's treated as MAX_INT
    (CWE-195), enabling buffer overflow (CWE-119) */
    strncpy(path, input, s);
    path[255] = '\0'; /* don't want CWE-170 */
    printf("Path is: %s\n", path);
}
```

This code first exhibits an example of CWE-839, allowing "s" to be a negative number. When the negative short "s" is converted to an unsigned integer, it becomes an extremely large positive integer. When this converted integer is used by strncpy() it will lead to a buffer overflow (CWE-119).

### Example 3:

In the following code, the method retrieves a value from an array at a specific array index location that is given as an input parameter to the method

Example Language: C

(bad)

```
int getValueFromArray(int *array, int len, int index) {
    int value;
    // check that the array index is less than the maximum
    // length of the array
    if (index < len) {
        // get the value at the specified index of the array
        value = array[index];
    }
    // if array index is invalid then output error message
    // and return value indicating error
    else {
        printf("Value is: %d\n", array[index]);
        value = -1;
    }
    return value;
}
```

However, this method only verifies that the given array index is less than the maximum length of the array but does not check for the minimum value (CWE-839). This will allow a negative value to be accepted as the input array index, which will result in a out of bounds read (CWE-125) and

may allow access to sensitive memory. The input array index should be checked to verify that is within the maximum and minimum range required for the array (CWE-129). In this example the if statement should be modified to include a minimum range check, as shown below.

Example Language: C

(good)

```
...
// check that the array index is within the correct
// range of values for the array
if (index >= 0 && index < len) {
...

```

#### Example 4:

The following code shows a simple BankAccount class with deposit and withdraw methods.

Example Language: Java

(bad)

```
public class BankAccount {
    public final int MAXIMUM_WITHDRAWAL_LIMIT = 350;
    // variable for bank account balance
    private double accountBalance;
    // constructor for BankAccount
    public BankAccount() {
        accountBalance = 0;
    }
    // method to deposit amount into BankAccount
    public void deposit(double depositAmount) {...}
    // method to withdraw amount from BankAccount
    public void withdraw(double withdrawAmount) {
        if (withdrawAmount < MAXIMUM_WITHDRAWAL_LIMIT) {
            double newBalance = accountBalance - withdrawAmount;
            accountBalance = newBalance;
        }
        else {
            System.err.println("Withdrawal amount exceeds the maximum limit allowed, please try again...");
            ...
        }
    }
    // other methods for accessing the BankAccount object
    ...
}

```

The withdraw method includes a check to ensure that the withdrawal amount does not exceed the maximum limit allowed, however the method does not check to ensure that the withdrawal amount is greater than a minimum value (CWE-129). Performing a range check on a value that does not include a minimum check can have significant security implications, in this case not including a minimum range check can allow a negative value to be used which would cause the financial application using this class to deposit money into the user account rather than withdrawing. In this example the if statement should be modified to include a minimum range check, as shown below.

Example Language: Java

(good)

```
public class BankAccount {
    public final int MINIMUM_WITHDRAWAL_LIMIT = 0;
    public final int MAXIMUM_WITHDRAWAL_LIMIT = 350;
    ...
    // method to withdraw amount from BankAccount
    public void withdraw(double withdrawAmount) {
        if (withdrawAmount < MAXIMUM_WITHDRAWAL_LIMIT &&
            withdrawAmount > MINIMUM_WITHDRAWAL_LIMIT) {
            ...
        }
    }
}

```

Note that this example does not protect against concurrent access to the BankAccount balance variable, see CWE-413 and CWE-362.

While it is out of scope for this example, note that the use of doubles or floats in financial calculations may be subject to certain kinds of attacks where attackers use rounding errors to steal money.

### Observed Examples

Reference	Description
<b>CVE-2010-1866</b>	Chain: integer overflow causes a negative signed value, which later bypasses a maximum-only check, leading to heap-based buffer overflow. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-1866">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-1866</a>
<b>CVE-2009-1099</b>	Chain: 16-bit counter can be interpreted as a negative value, compared to a 32-bit maximum value, leading to buffer under-write. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1099">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-1099</a>
<b>CVE-2011-0521</b>	Chain: kernel's lack of a check for a negative value leads to memory corruption. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0521">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0521</a>
<b>CVE-2010-3704</b>	Chain: parser uses atoi() but does not check for a negative value, which can happen on some platforms, leading to buffer under-write. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3704">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3704</a>
<b>CVE-2010-2530</b>	Chain: Negative value stored in an int bypasses a size check and causes allocation of large amounts of memory. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2530">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2530</a>
<b>CVE-2009-3080</b>	Chain: negative offset value to IOCTL bypasses check for maximum index, then used as an array index for buffer under-read. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3080">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3080</a>
<b>CVE-2008-6393</b>	chain: file transfer client performs signed comparison, leading to integer overflow and heap-based buffer overflow. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6393">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-6393</a>
<b>CVE-2008-4558</b>	chain: negative ID in media player bypasses check for maximum index, then used as an array index for buffer under-read. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4558">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4558</a>

## CWE-841: Improper Enforcement of Behavioral Workflow

Weakness ID : 841

Status: Incomplete

Structure : Simple

Abstraction : Base

### Description

The software supports a session in which more than one behavior must be performed by an actor, but it does not properly ensure that the actor performs the behaviors in the required sequence.

### Extended Description

By performing actions in an unexpected order, or by omitting steps, an attacker could manipulate the business logic of the software or cause it to enter an invalid state. In some cases, this can also expose resultant weaknesses.

For example, a file-sharing protocol might require that an actor perform separate steps to provide a username, then a password, before being able to transfer files. If the file-sharing server accepts a password command followed by a transfer command, without any username being provided, the software might still perform the transfer.

Note that this is different than CWE-696, which focuses on when the software performs actions in the wrong sequence; this entry is closely related, but it is focused on ensuring that the actor performs actions in the correct sequence.

Workflow-related behaviors include:

- Steps are performed in the expected order.
- Required steps are not omitted.
- Steps are not interrupted.
- Steps are performed in a timely fashion.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		691	Insufficient Control Flow Management	1342

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1018	Manage User Sessions	1853

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		438	Behavioral Problems	1747
MemberOf		840	Business Logic Errors	1783

### Common Consequences

Scope	Impact	Likelihood
Other	Alter Execution Logic	
	<i>An attacker could cause the software to skip critical steps or perform them in the wrong order, bypassing its intended business logic. This can sometimes have security implications.</i>	

### Demonstrative Examples

#### Example 1:

This code is part of an FTP server and deals with various commands that could be sent by a user. It is intended that a user must successfully login before performing any other action such as retrieving or listing files.

Example Language: Python

(bad)

```
def dispatchCommand(command, user, args):
    if command == 'Login':
        loginUser(args)
        return
    # user has requested a file
    if command == 'Retrieve_file':
        if authenticated(user) and ownsFile(user,args):
            sendFile(args)
            return
    if command == 'List_files':
        listFiles(args)
        return
    ...
```

The server correctly does not send files to a user that isn't logged in and doesn't own the file. However, the server will incorrectly list the files in any directory without confirming the command came from an authenticated user, and that the user is authorized to see the directory's contents.

Here is a fixed version of the above example:

Example Language: Python

(good)

```
def dispatchCommand(command, user, args):
    ...
    if command == 'List_files':
        if authenticated(user) and ownsDirectory(user,args):
            listFiles(args)
            return
    ...
```

## Observed Examples

Reference	Description
<b>CVE-2011-0348</b>	Bypass of access/billing restrictions by sending traffic to an unrestricted destination before sending to a restricted destination. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0348">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0348</a>
<b>CVE-2007-3012</b>	Attacker can access portions of a restricted page by canceling out of a dialog. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-3012">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-3012</a>
<b>CVE-2009-5056</b>	Ticket-tracking system does not enforce a permission setting. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-5056">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-5056</a>
<b>CVE-2004-2164</b>	Shopping cart does not close a database connection when user restores a previous order, leading to connection exhaustion. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-2164">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-2164</a>
<b>CVE-2003-0777</b>	Chain: product does not properly handle dropped connections, leading to missing NULL terminator (CWE-170) and segmentation fault. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0777">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2003-0777</a>
<b>CVE-2005-3327</b>	Chain: Authentication bypass by skipping the first startup step as required by the protocol. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3327">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3327</a>
<b>CVE-2004-0829</b>	Chain: File server crashes when sent a "find next" request without an initial "find first." <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0829">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-0829</a>

Reference	Description
<b>CVE-2010-2620</b>	FTP server allows remote attackers to bypass authentication by sending (1) LIST, (2) RETR, (3) STOR, or other commands without performing the required login steps first. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2620">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-2620</a>
<b>CVE-2005-3296</b>	FTP server allows remote attackers to list arbitrary directories as root by running the LIST command before logging in. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3296">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-3296</a>

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	<input type="checkbox"/>	Page
MemberOf	<input checked="" type="checkbox"/>	867	2011 Top 25 - Weaknesses On the Cusp	<input type="checkbox"/>	900 1795
MemberOf	<input type="checkbox"/>	884	CWE Cross-section	<input type="checkbox"/>	884 1902

### Notes

#### Research Gap

This weakness is typically associated with business logic flaws, except when it produces resultant weaknesses. The classification of business logic flaws has been under-studied, although exploitation of business flaws frequently happens in real-world systems, and many applied vulnerability researchers investigate them. The greatest focus is in web applications. There is debate within the community about whether these problems represent particularly new concepts, or if they are variations of well-known principles. Many business logic flaws appear to be oriented toward business processes, application flows, and sequences of behaviors, which are not as well-represented in CWE as weaknesses related to input validation, memory management, etc.

## CWE-842: Placement of User into Incorrect Group

**Weakness ID** : 842

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software or the administrator places a user into an incorrect group.

### Extended Description

If the incorrect group has more access or privileges than the intended group, the user might be able to bypass intended security policy to access unexpected resources or perform unexpected actions. The access-control system might not be able to detect malicious usage of this group membership.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		286	Incorrect User Management	629

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		286	Incorrect User Management	629

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Access Control	Gain Privileges or Assume Identity	

### Observed Examples

Reference	Description
<b>CVE-1999-1193</b>	Operating system assigns user to privileged wheel group, allowing the user to gain root privileges. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1193">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1193</a>
<b>CVE-2010-3716</b>	Chain: drafted web request allows the creation of users with arbitrary group membership. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3716">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3716</a>
<b>CVE-2008-5397</b>	Chain: improper processing of configuration options causes users to contain unintended group memberships. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5397">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-5397</a>
<b>CVE-2007-6644</b>	CMS does not prevent remote administrators from promoting other users to the administrator group, in violation of the intended security model. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6644">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6644</a>
<b>CVE-2007-3260</b>	Product assigns members to the root group, allowing escalation of privileges.

Reference	Description
	<a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-3260">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-3260</a>
<b>CVE-2002-0080</b>	Chain: daemon does not properly clear groups before dropping privileges. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-0080">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-0080</a>

## CWE-843: Access of Resource Using Incompatible Type ('Type Confusion')

**Weakness ID** : 843

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The program allocates or initializes a resource such as a pointer, object, or variable using one type, but it later accesses that resource using a type that is incompatible with the original type.

### Extended Description

When the program accesses the resource using an incompatible type, this could trigger logical errors because the resource does not have expected properties. In languages without memory safety, such as C and C++, type confusion can lead to out-of-bounds memory access.

While this weakness is frequently associated with unions when parsing data with many different embedded object types in C, it can be present in any application that can interpret the same variable or memory location in multiple ways.

This weakness is not unique to C and C++. For example, errors in PHP applications can be triggered by providing array parameters when scalars are expected, or vice versa. Languages such as Perl, which perform automatic conversion of a variable of one type when it is accessed as if it were another type, can also contain these issues.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		704	Incorrect Type Conversion or Cast	1358
CanPrecede		119	Improper Restriction of Operations within the Bounds of a Memory Buffer	276

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		704	Incorrect Type Conversion or Cast	1358

### Applicable Platforms

**Language** : C (Prevalence = Undetermined)

**Language** : C++ (Prevalence = Undetermined)

### Alternate Terms

**Object Type Confusion** :

### Demonstrative Examples

**Example 1:**

The following code uses a union to support the representation of different types of messages. It formats messages differently, depending on their type.

Example Language: C

(bad)

```
#define NAME_TYPE 1
#define ID_TYPE 2
struct MessageBuffer
{
    int msgType;
    union {
        char *name;
        int nameID;
    };
};
int main (int argc, char **argv) {
    struct MessageBuffer buf;
    char *defaultMessage = "Hello World";
    buf.msgType = NAME_TYPE;
    buf.name = defaultMessage;
    printf("Pointer of buf.name is %p\n", buf.name);
    /* This particular value for nameID is used to make the code architecture-independent. If coming from untrusted input, it
    could be any value. */
    buf.nameID = (int)(defaultMessage + 1);
    printf("Pointer of buf.name is now %p\n", buf.name);
    if (buf.msgType == NAME_TYPE) {
        printf("Message: %s\n", buf.name);
    }
    else {
        printf("Message: Use ID %d\n", buf.nameID);
    }
}
```

The code intends to process the message as a NAME\_TYPE, and sets the default message to "Hello World." However, since both buf.name and buf.nameID are part of the same union, they can act as aliases for the same memory location, depending on memory layout after compilation.

As a result, modification of buf.nameID - an int - can effectively modify the pointer that is stored in buf.name - a string.

Execution of the program might generate output such as:

```
Pointer of name is 10830
Pointer of name is now 10831
Message: ello World
```

Notice how the pointer for buf.name was changed, even though buf.name was not explicitly modified.

In this case, the first "H" character of the message is omitted. However, if an attacker is able to fully control the value of buf.nameID, then buf.name could contain an arbitrary pointer, leading to out-of-bounds reads or writes.

### Example 2:

The following PHP code accepts a value, adds 5, and prints the sum.

Example Language: PHP

(bad)

```
$value = $_GET['value'];
$sum = $value + 5;
echo "value parameter is '$value'<p>";
echo "SUM is $sum";
```

When called with the following query string:

```
value=123
```

the program calculates the sum and prints out:

SUM is 128

However, the attacker could supply a query string such as:

value[]=123

The "[]" array syntax causes \$value to be treated as an array type, which then generates a fatal error when calculating \$sum:

Fatal error: Unsupported operand types in program.php on line 2

### Example 3:

The following Perl code is intended to look up the privileges for user ID's between 0 and 3, by performing an access of the \$UserPrivilegeArray reference. It is expected that only userID 3 is an admin (since this is listed in the third element of the array).

*Example Language: Perl*

*(bad)*

```
my $UserPrivilegeArray = ["user", "user", "admin", "user"];
my $userID = get_current_user_ID();
if ($UserPrivilegeArray eq "user") {
    print "Regular user!\n";
}
else {
    print "Admin!\n";
}
print "\$UserPrivilegeArray = $UserPrivilegeArray\n";
```

In this case, the programmer intended to use "\$UserPrivilegeArray->{\$userID}" to access the proper position in the array. But because the subscript was omitted, the "user" string was compared to the scalar representation of the \$UserPrivilegeArray reference, which might be of the form "ARRAY(0x229e8)" or similar.

Since the logic also "fails open" (CWE-636), the result of this bug is that all users are assigned administrator privileges.

While this is a forced example, it demonstrates how type confusion can have security consequences, even in memory-safe languages.

### Observed Examples

Reference	Description
<b>CVE-2010-4577</b>	Type confusion in CSS sequence leads to out-of-bounds read. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-4577">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-4577</a>
<b>CVE-2011-0611</b>	Size inconsistency allows code execution, first discovered when it was actively exploited in-the-wild. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0611">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-0611</a>
<b>CVE-2010-0258</b>	Improperly-parsed file containing records of different types leads to code execution when a memory location is interpreted as a different object than intended. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-0258">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-0258</a>

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf		1157	SEI CERT C Coding Standard - Guidelines 03. Expressions (EXP)		1154 1876

### Notes

### Applicable Platform

This weakness is possible in any type-unsafe programming language.

### Research Gap

Type confusion weaknesses have received some attention by applied researchers and major software vendors for C and C++ code. Some publicly-reported vulnerabilities probably have type confusion as a root-cause weakness, but these may be described as "memory corruption" instead. This weakness seems likely to gain prominence in upcoming years. For other languages, there are very few public reports of type confusion weaknesses. These are probably under-studied. Since many programs rely directly or indirectly on loose typing, a potential "type confusion" behavior might be intentional, possibly requiring more manual analysis.

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name

## CWE-862: Missing Authorization

<b>Weakness ID</b> : 862	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The software does not perform an authorization check when an actor attempts to access a resource or perform an action.

### Extended Description

Assuming a user with a given identity, authorization is the process of determining whether that user can access a given resource, based on the user's privileges and any permissions or other access-control specifications that apply to the resource.

When access control checks are not applied, users are able to access data or perform actions that they should not be allowed to perform. This can lead to a wide range of problems, including information exposures, denial of service, and arbitrary code execution.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

ParentOf	B	639	Authorization Bypass Through User-Controlled Key	1250
ParentOf	B	939	Improper Authorization in Handler for Custom URL Scheme	1611

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Web Server (*Prevalence = Often*)

**Technology** : Database Server (*Prevalence = Often*)

### Background Details

An access control list (ACL) represents who/what has permissions to a given object. Different operating systems implement (ACLs) in different ways. In UNIX, there are three types of permissions: read, write, and execute. Users are divided into three classes for file access: owner, group owner, and all other users where each class has a separate set of rights. In Windows NT, there are four basic types of permissions for files: "No access", "Read access", "Change access", and "Full control". Windows NT extends the concept of three types of users in UNIX to include a list of users and groups along with their associated permissions. A user can create an object (file) and assign specified permissions to that object.

### Alternate Terms

**AuthZ** : "AuthZ" is typically used as an abbreviation of "authorization" within the web application security community. It is also distinct from "AuthC," which is an abbreviation of "authentication." The use of "Auth" as an abbreviation is discouraged, since it could be used for either authentication or authorization.

### Likelihood Of Exploit

High

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Read Files or Directories  <i>An attacker could read sensitive data, either by reading the data directly from a data store that is not restricted, or by accessing insufficiently-protected, privileged functionality to read the data.</i>	
Integrity	Modify Application Data Modify Files or Directories  <i>An attacker could modify sensitive data, either by writing the data directly to a data store that is not restricted, or by accessing insufficiently-protected, privileged functionality to write the data.</i>	

Scope	Impact	Likelihood
Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism  <i>An attacker could gain privileges by modifying or reading critical data directly, or by accessing privileged functionality.</i>	

## Detection Methods

### Automated Static Analysis

Automated static analysis is useful for detecting commonly-used idioms for authorization. A tool may be able to analyze related configuration files, such as .htaccess in Apache web servers, or detect the usage of commonly-used authorization libraries. Generally, automated static analysis tools have difficulty detecting custom authorization schemes. In addition, the software's design may include some functionality that is accessible to any user and does not require an authorization check; an automated technique that detects the absence of authorization may report false positives.

*Effectiveness = Limited*

### Automated Dynamic Analysis

Automated dynamic analysis may find many or all possible interfaces that do not require authorization, but manual analysis is required to determine if the lack of authorization violates business logic.

### Manual Analysis

This weakness can be detected using tools and techniques that require manual (human) analysis, such as penetration testing, threat modeling, and interactive tools that allow the tester to record and modify an active session. Specifically, manual static analysis is useful for evaluating the correctness of custom authorization mechanisms.

*Effectiveness = Moderate*

*These may be more effective than strictly automated techniques. This is especially the case with weaknesses that are related to design and business rules. However, manual efforts might not achieve desired code coverage within limited time constraints.*

### Manual Static Analysis - Binary or Bytecode

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Binary / Bytecode disassembler - then use manual analysis for vulnerabilities & anomalies

*Effectiveness = SOAR Partial*

### Dynamic Analysis with Automated Results Interpretation

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Web Application Scanner Web Services Scanner Database Scanners

*Effectiveness = SOAR Partial*

### Dynamic Analysis with Manual Results Interpretation

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Host Application Interface Scanner Fuzz Tester Framework-based Fuzzer

*Effectiveness = SOAR Partial*

### Manual Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Focused Manual Spotcheck - Focused manual analysis of source Manual Source Code Review (not inspections)

*Effectiveness = SOAR Partial*

### **Automated Static Analysis - Source Code**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Source code Weakness Analyzer Context-configured Source Code Weakness Analyzer

*Effectiveness = SOAR Partial*

### **Architecture or Design Review**

According to SOAR, the following detection techniques may be useful: Highly cost effective: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.) Formal Methods / Correct-By-Construction

*Effectiveness = High*

## **Potential Mitigations**

### **Phase: Architecture and Design**

Divide the software into anonymous, normal, privileged, and administrative areas. Reduce the attack surface by carefully mapping roles with data and functionality. Use role-based access control (RBAC) [REF-229] to enforce the roles at the appropriate boundaries. Note that this approach may not protect against horizontal authorization, i.e., it will not protect a user from attacking others with the same role.

### **Phase: Architecture and Design**

Ensure that access control checks are performed related to the business logic. These checks may be different than the access control checks that are applied to more generic resources such as files, connections, processes, memory, and database records. For example, a database may restrict access for medical records to a specific database user, but each record might only be intended to be accessible to the patient and the patient's doctor [REF-7].

### **Phase: Architecture and Design**

*Strategy = Libraries or Frameworks*

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. For example, consider using authorization frameworks such as the JAAS Authorization Framework [REF-233] and the OWASP ESAPI Access Control feature [REF-45].

### **Phase: Architecture and Design**

For web applications, make sure that the access control mechanism is enforced correctly at the server side on every page. Users should not be able to access any unauthorized functionality or information by simply requesting direct access to that page. One way to do this is to ensure that all pages containing sensitive information are not cached, and that all such pages restrict access to requests that are accompanied by an active and authenticated session token associated with a user who has the required permissions to access that page.

### **Phase: System Configuration**

#### **Phase: Installation**

Use the access control capabilities of your operating system and server environment and define your access control lists accordingly. Use a "default deny" policy when defining these ACLs.

## **Demonstrative Examples**

### **Example 1:**

This function runs an arbitrary SQL query on a given database, returning the result of the query.

Example Language: PHP

(bad)

```
function runEmployeeQuery($dbName, $name){
    mysql_select_db($dbName,$globalDbHandle) or die("Could not open Database".$dbName);
    //Use a prepared statement to avoid CWE-89
    $preparedStatement = $globalDbHandle->prepare("SELECT * FROM employees WHERE name = :name");
    $preparedStatement->execute(array(':name' => $name));
    return $preparedStatement->fetchAll();
}
.../
$employeeRecord = runEmployeeQuery('EmployeeDB',$_GET['EmployeeName']);
```

While this code is careful to avoid SQL Injection, the function does not confirm the user sending the query is authorized to do so. An attacker may be able to obtain sensitive employee information from the database.

### Example 2:

The following program could be part of a bulletin board system that allows users to send private messages to each other. This program intends to authenticate the user before deciding whether a private message should be displayed. Assume that `LookupMessageObject()` ensures that the `$id` argument is numeric, constructs a filename based on that id, and reads the message details from that file. Also assume that the program stores all private messages for all users in the same directory.

Example Language: Perl

(bad)

```
sub DisplayPrivateMessage {
    my($id) = @_;
    my $Message = LookupMessageObject($id);
    print "From: " . encodeHTML($Message->{from}) . "<br>\n";
    print "Subject: " . encodeHTML($Message->{subject}) . "\n";
    print "<hr>\n";
    print "Body: " . encodeHTML($Message->{body}) . "\n";
}
my $q = new CGI;
# For purposes of this example, assume that CWE-309 and
# CWE-523 do not apply.
if (! AuthenticateUser($q->param('username'), $q->param('password'))) {
    ExitError("invalid username or password");
}
my $id = $q->param('id');
DisplayPrivateMessage($id);
```

While the program properly exits if authentication fails, it does not ensure that the message is addressed to the user. As a result, an authenticated attacker could provide any arbitrary identifier and read private messages that were intended for other users.

One way to avoid this problem would be to ensure that the "to" field in the message object matches the username of the authenticated user.

### Observed Examples

Reference	Description
<b>CVE-2009-3168</b>	Web application does not restrict access to admin scripts, allowing authenticated users to reset administrative passwords. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3168">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3168</a>
<b>CVE-2009-3597</b>	Web application stores database file under the web root with insufficient access control (CWE-219), allowing direct request. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3597">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-3597</a>

## CWE-863: Incorrect Authorization

**Weakness ID** : 863

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Class

### Description

The software performs an authorization check when an actor attempts to access a resource or perform an action, but it does not correctly perform the check. This allows attackers to bypass intended access restrictions.

### Extended Description

Assuming a user with a given identity, authorization is the process of determining whether that user can access a given resource, based on the user's privileges and any permissions or other access-control specifications that apply to the resource.

When access control checks are incorrectly applied, users are able to access data or perform actions that they should not be allowed to perform. This can lead to a wide range of problems, including information exposures, denial of service, and arbitrary code execution.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

ParentOf		551	Incorrect Behavior Order: Authorization Before Parsing and Canonicalization	1121
ParentOf		647	Use of Non-Canonical URL Paths for Authorization Decisions	1269
ParentOf		804	Guessable CAPTCHA	1493

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Technology** : Web Server (*Prevalence = Often*)

**Technology** : Database Server (*Prevalence = Often*)

### Background Details

An access control list (ACL) represents who/what has permissions to a given object. Different operating systems implement (ACLs) in different ways. In UNIX, there are three types of permissions: read, write, and execute. Users are divided into three classes for file access: owner, group owner, and all other users where each class has a separate set of rights. In Windows NT, there are four basic types of permissions for files: "No access", "Read access", "Change access", and "Full control". Windows NT extends the concept of three types of users in UNIX to include a list of users and groups along with their associated permissions. A user can create an object (file) and assign specified permissions to that object.

### Alternate Terms

**AuthZ** : "AuthZ" is typically used as an abbreviation of "authorization" within the web application security community. It is also distinct from "AuthC," which is an abbreviation of "authentication." The use of "Auth" as an abbreviation is discouraged, since it could be used for either authentication or authorization.

### Likelihood Of Exploit

High

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Read Files or Directories  <i>An attacker could read sensitive data, either by reading the data directly from a data store that is not correctly restricted, or by accessing insufficiently-protected, privileged functionality to read the data.</i>	
Integrity	Modify Application Data	

Scope	Impact	Likelihood
	Modify Files or Directories  <i>An attacker could modify sensitive data, either by writing the data directly to a data store that is not correctly restricted, or by accessing insufficiently-protected, privileged functionality to write the data.</i>	
Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism  <i>An attacker could gain privileges by modifying or reading critical data directly, or by accessing privileged functionality.</i>	

## Detection Methods

### Automated Static Analysis

Automated static analysis is useful for detecting commonly-used idioms for authorization. A tool may be able to analyze related configuration files, such as .htaccess in Apache web servers, or detect the usage of commonly-used authorization libraries. Generally, automated static analysis tools have difficulty detecting custom authorization schemes. Even if they can be customized to recognize these schemes, they might not be able to tell whether the scheme correctly performs the authorization in a way that cannot be bypassed or subverted by an attacker.

*Effectiveness = Limited*

### Automated Dynamic Analysis

Automated dynamic analysis may not be able to find interfaces that are protected by authorization checks, even if those checks contain weaknesses.

### Manual Analysis

This weakness can be detected using tools and techniques that require manual (human) analysis, such as penetration testing, threat modeling, and interactive tools that allow the tester to record and modify an active session. Specifically, manual static analysis is useful for evaluating the correctness of custom authorization mechanisms.

*Effectiveness = Moderate*

*These may be more effective than strictly automated techniques. This is especially the case with weaknesses that are related to design and business rules. However, manual efforts might not achieve desired code coverage within limited time constraints.*

### Manual Static Analysis - Binary or Bytecode

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Binary / Bytecode disassembler - then use manual analysis for vulnerabilities & anomalies

*Effectiveness = SOAR Partial*

### Dynamic Analysis with Automated Results Interpretation

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Web Application Scanner Web Services Scanner Database Scanners

*Effectiveness = SOAR Partial*

### Dynamic Analysis with Manual Results Interpretation

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Host Application Interface Scanner Fuzz Tester Framework-based Fuzzer Forced Path Execution Monitored Virtual Environment - run potentially malicious code in sandbox / wrapper / virtual machine, see if it does anything suspicious

*Effectiveness = SOAR Partial*

### **Manual Static Analysis - Source Code**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Focused Manual Spotcheck - Focused manual analysis of source Manual Source Code Review (not inspections)

*Effectiveness = SOAR Partial*

### **Automated Static Analysis - Source Code**

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Context-configured Source Code Weakness Analyzer

*Effectiveness = SOAR Partial*

### **Architecture or Design Review**

According to SOAR, the following detection techniques may be useful: Highly cost effective: Formal Methods / Correct-By-Construction Cost effective for partial coverage: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.)

*Effectiveness = High*

## **Potential Mitigations**

### **Phase: Architecture and Design**

Divide the software into anonymous, normal, privileged, and administrative areas. Reduce the attack surface by carefully mapping roles with data and functionality. Use role-based access control (RBAC) [REF-229] to enforce the roles at the appropriate boundaries. Note that this approach may not protect against horizontal authorization, i.e., it will not protect a user from attacking others with the same role.

### **Phase: Architecture and Design**

Ensure that access control checks are performed related to the business logic. These checks may be different than the access control checks that are applied to more generic resources such as files, connections, processes, memory, and database records. For example, a database may restrict access for medical records to a specific database user, but each record might only be intended to be accessible to the patient and the patient's doctor [REF-7].

### **Phase: Architecture and Design**

*Strategy = Libraries or Frameworks*

Use a vetted library or framework that does not allow this weakness to occur or provides constructs that make this weakness easier to avoid. For example, consider using authorization frameworks such as the JAAS Authorization Framework [REF-233] and the OWASP ESAPI Access Control feature [REF-45].

### **Phase: Architecture and Design**

For web applications, make sure that the access control mechanism is enforced correctly at the server side on every page. Users should not be able to access any unauthorized functionality or information by simply requesting direct access to that page. One way to do this is to ensure that all pages containing sensitive information are not cached, and that all such pages restrict access to requests that are accompanied by an active and authenticated session token associated with a user who has the required permissions to access that page.

### **Phase: System Configuration**

### **Phase: Installation**

Use the access control capabilities of your operating system and server environment and define your access control lists accordingly. Use a "default deny" policy when defining these ACLs.

## Demonstrative Examples

### Example 1:

The following code could be for a medical records application. It displays a record to already authenticated users, confirming the user's authorization using a value stored in a cookie.

Example Language: PHP

(bad)

```
$role = $_COOKIES['role'];
if (!$role) {
    $role = getRole('user');
    if ($role) {
        // save the cookie to send out in future responses
        setcookie("role", $role, time()+60*60*2);
    }
    else{
        ShowLoginScreen();
        die("\n");
    }
}
if ($role == 'Reader') {
    DisplayMedicalHistory($_POST['patient_ID']);
}
else{
    die("You are not Authorized to view this record\n");
}
```

The programmer expects that the cookie will only be set when `getRole()` succeeds. The programmer even diligently specifies a 2-hour expiration for the cookie. However, the attacker can easily set the "role" cookie to the value "Reader". As a result, the `$role` variable is "Reader", and `getRole()` is never invoked. The attacker has bypassed the authorization system.

## Observed Examples

Reference	Description
<b>CVE-2009-2213</b>	Gateway uses default "Allow" configuration for its authorization settings. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2213">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-2213</a>

## CWE-908: Use of Uninitialized Resource

<b>Weakness ID</b> : 908	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software uses a resource that has not been properly initialized.

### Extended Description

This can have security implications when the associated resource is expected to have certain properties or values.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		664	Improper Control of a Resource Through its Lifetime	1291
CanFollow		909	Missing Initialization of Resource	1578

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		452	Initialization and Cleanup Errors	1749

### Weakness Ordinalities

**Primary :**

**Resultant :**

### Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

### Likelihood Of Exploit

Medium

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory Read Application Data  <i>When reusing a resource such as memory or a program variable, the original contents of that resource may not be cleared before it is sent to an untrusted party.</i>	
Availability	DoS: Crash, Exit, or Restart  <i>The uninitialized resource may contain values that cause program flow to change in ways that the programmer did not intend.</i>	

### Potential Mitigations

#### Phase: Implementation

Explicitly initialize the resource before use. If this is performed through an API function or standard procedure, follow all required steps.

#### Phase: Implementation

Pay close attention to complex conditionals that affect initialization, since some branches might not perform the initialization.

#### Phase: Implementation

Avoid race conditions (CWE-362) during initialization routines.

#### Phase: Build and Compilation

Run or compile the software with settings that generate warnings about uninitialized variables or data.

### Demonstrative Examples

#### Example 1:

Here, a boolean initialized field is consulted to ensure that initialization tasks are only completed once. However, the field is mistakenly set to true during static initialization, so the initialization code is never reached.

Example Language: Java

(bad)

```
private boolean initialized = true;
public void someMethod() {
    if (!initialized) {
        // perform initialization tasks
        ...
        initialized = true;
    }
}
```

### Example 2:

The following code intends to limit certain operations to the administrator only.

Example Language: Perl

(bad)

```
$username = GetCurrentUser();
$state = GetStateData($username);
if (defined($state)) {
    $uid = ExtractUserID($state);
}
# do stuff
if ($uid == 0) {
    DoAdminThings();
}
```

If the application is unable to extract the state information - say, due to a database timeout - then the \$uid variable will not be explicitly set by the programmer. This will cause \$uid to be regarded as equivalent to "0" in the conditional, allowing the original user to perform administrator actions. Even if the attacker cannot directly influence the state data, unexpected errors could cause incorrect privileges to be assigned to a user just by accident.

### Example 3:

The following code intends to concatenate a string to a variable and print the string.

Example Language: C

(bad)

```
char str[20];
strcat(str, "hello world");
printf("%s", str);
```

This might seem innocent enough, but str was not initialized, so it contains random memory. As a result, str[0] might not contain the null terminator, so the copy might start at an offset other than 0. The consequences can vary, depending on the underlying memory.

If a null terminator is found before str[8], then some bytes of random garbage will be printed before the "hello world" string. The memory might contain sensitive information from previous uses, such as a password (which might occur as a result of CWE-14 or CWE-244). In this example, it might not be a big deal, but consider what could happen if large amounts of memory are printed out before the null terminator is found.

If a null terminator isn't found before str[8], then a buffer overflow could occur, since strcat will first look for the null terminator, then copy 12 bytes starting with that location. Alternately, a buffer over-read might occur (CWE-126) if a null terminator isn't found before the end of the memory segment is reached, leading to a segmentation fault and crash.

## Observed Examples

Reference	Description
<b>CVE-2008-4197</b>	Use of uninitialized memory may allow code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4197">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4197</a>
<b>CVE-2008-2934</b>	Free of an uninitialized pointer leads to crash and possible code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-2934">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-2934</a>

Reference	Description
<b>CVE-2008-0063</b>	Product does not clear memory contents when generating an error message, leading to information leak. <i><a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-0063">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-0063</a></i>
<b>CVE-2008-0062</b>	Lack of initialization triggers NULL pointer dereference or double-free. <i><a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-0062">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-0062</a></i>
<b>CVE-2008-0081</b>	Uninitialized variable leads to code execution in popular desktop application. <i><a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-0081">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-0081</a></i>
<b>CVE-2008-3688</b>	chain: Uninitialized variable leads to infinite loop. <i><a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-3688">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-3688</a></i>

## CWE-909: Missing Initialization of Resource

<b>Weakness ID</b> : 909	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software does not initialize a critical resource.

### Extended Description

Many resources require initialization before they can be properly used. If a resource is not initialized, it could contain unpredictable or expired data, or it could be initialized to defaults that are invalid. This can have security implications when the resource is expected to have certain properties or values.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		665	Improper Initialization	1293
ParentOf		456	Missing Initialization of a Variable	971
CanPrecede		908	Use of Uninitialized Resource	1575

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		452	Initialization and Cleanup Errors	1749

## Weakness Ordinalities

**Primary :**

**Resultant :**

## Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

## Likelihood Of Exploit

Medium

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Memory Read Application Data  <i>When reusing a resource such as memory or a program variable, the original contents of that resource may not be cleared before it is sent to an untrusted party.</i>	
Availability	DoS: Crash, Exit, or Restart  <i>The uninitialized resource may contain values that cause program flow to change in ways that the programmer did not intend.</i>	

## Potential Mitigations

### Phase: Implementation

Explicitly initialize the resource before use. If this is performed through an API function or standard procedure, follow all specified steps.

### Phase: Implementation

Pay close attention to complex conditionals that affect initialization, since some branches might not perform the initialization.

### Phase: Implementation

Avoid race conditions (CWE-362) during initialization routines.

### Phase: Build and Compilation

Run or compile your software with settings that generate warnings about uninitialized variables or data.

### Demonstrative Examples

#### Example 1:

Here, a boolean initialized field is consulted to ensure that initialization tasks are only completed once. However, the field is mistakenly set to true during static initialization, so the initialization code is never reached.

*Example Language: Java*

*(bad)*

```
private boolean initialized = true;
public void someMethod() {
    if (!initialized) {
        // perform initialization tasks
        ...
        initialized = true;
    }
}
```

#### Example 2:

The following code intends to limit certain operations to the administrator only.

*Example Language: Perl*

*(bad)*

```
$username = GetCurrentUser();
$state = GetStateData($username);
if (defined($state)) {
    $uid = ExtractUserID($state);
}
# do stuff
if ($uid == 0) {
    DoAdminThings();
}
```

If the application is unable to extract the state information - say, due to a database timeout - then the \$uid variable will not be explicitly set by the programmer. This will cause \$uid to be regarded as equivalent to "0" in the conditional, allowing the original user to perform administrator actions. Even if the attacker cannot directly influence the state data, unexpected errors could cause incorrect privileges to be assigned to a user just by accident.

#### Example 3:

The following code intends to concatenate a string to a variable and print the string.

*Example Language: C*

*(bad)*

```
char str[20];
strcat(str, "hello world");
printf("%s", str);
```

This might seem innocent enough, but str was not initialized, so it contains random memory. As a result, str[0] might not contain the null terminator, so the copy might start at an offset other than 0. The consequences can vary, depending on the underlying memory.

If a null terminator is found before str[8], then some bytes of random garbage will be printed before the "hello world" string. The memory might contain sensitive information from previous uses, such as a password (which might occur as a result of CWE-14 or CWE-244). In this example, it might not be a big deal, but consider what could happen if large amounts of memory are printed out before the null terminator is found.

If a null terminator isn't found before `str[8]`, then a buffer overflow could occur, since `strcat` will first look for the null terminator, then copy 12 bytes starting with that location. Alternately, a buffer over-read might occur (CWE-126) if a null terminator isn't found before the end of the memory segment is reached, leading to a segmentation fault and crash.

## CWE-910: Use of Expired File Descriptor

**Weakness ID** : 910

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software uses or accesses a file descriptor after it has been closed.

### Extended Description

After a file descriptor for a particular file or device has been released, it can be reused. The code might not write to the original file, since the reused file descriptor might reference a different file or device.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as `ChildOf`, `ParentOf`, `MemberOf` and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as `PeerOf` and `CanAlsoBe` are defined to show similar weaknesses that may want to be explored.

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
CERT C Secure Coding	FIO46-C	Exact	Do not access a closed file

## CWE-911: Improper Update of Reference Count

<b>Weakness ID</b> : 911	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software uses a reference count to manage a resource, but it does not update or incorrectly updates the reference count.

### Extended Description

Reference counts can be used when tracking how many objects contain a reference to a particular resource, such as in memory management or garbage collection. When the reference count reaches zero, the resource can be de-allocated or reused because there are no more objects that use it. If the reference count accidentally reaches zero, then the resource might be released too soon, even though it is still in use. If all objects no longer use the resource, but the reference count is not zero, then the resource might not ever be released.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-912: Hidden Functionality

<b>Weakness ID</b> : 912	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The software contains functionality that is not documented, not part of the specification, and not accessible through an interface or command sequence that is obvious to the software's users or administrators.

### Extended Description

Hidden functionality can take many forms, such as intentionally malicious code, "Easter Eggs" that contain extraneous functionality such as games, developer-friendly shortcuts that reduce maintenance or support costs such as hard-coded accounts, etc. From a security perspective, even when the functionality is not intentionally malicious or damaging, it can increase the software's attack surface and expose additional weaknesses beyond what is already exposed by the intended functionality. Even if it is not easily accessible, the hidden functionality could be useful for attacks that modify the control flow of the application.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		710	Improper Adherence to Coding Standards	1366

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		438	Behavioral Problems	1747
ParentOf		506	Embedded Malicious Code	1074
ParentOf		514	Covert Channel	1083

### Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	
Integrity	Alter Execution Logic	

### Potential Mitigations

#### Phase: Installation

Always verify the integrity of the software that is being installed.

#### Phase: Testing

Conduct a code coverage analysis using live testing, then closely inspect any code that is not covered.

## CWE-913: Improper Control of Dynamically-Managed Code Resources

**Weakness ID** : 913

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Class

### Description

The software does not properly restrict reading from or writing to dynamically-managed code resources such as variables, objects, classes, attributes, functions, or executable instructions or statements.

### Extended Description

Many languages offer powerful features that allow the programmer to dynamically create or modify existing code, or resources used by code such as variables and objects. While these features can offer significant flexibility and reduce development time, they can be extremely dangerous if attackers can directly influence these code resources in unexpected ways.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		664	Improper Control of a Resource Through its Lifetime	1291

### Common Consequences

Scope	Impact	Likelihood
Integrity	Execute Unauthorized Code or Commands	
Other	Varies by Context	
Integrity	Alter Execution Logic	

### Potential Mitigations

**Phase: Implementation***Strategy = Input Validation*

For any externally-influenced input, check the input against a white list of acceptable values.

**Phase: Implementation****Phase: Architecture and Design***Strategy = Refactoring*

Refactor the code so that it does not need to be dynamically managed.

**CWE-914: Improper Control of Dynamically-Identified Variables****Weakness ID** : 914**Status**: Incomplete**Structure** : Simple**Abstraction** : Base**Description**

The software does not properly restrict reading from or writing to dynamically-identified variables.

**Extended Description**

Many languages offer powerful features that allow the programmer to access arbitrary variables that are specified by an input string. While these features can offer significant flexibility and reduce development time, they can be extremely dangerous if attackers can modify unintended variables that have security implications.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page

ParentOf		627	Dynamic Variable Evaluation	1240

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		99	Improper Control of Resource Identifiers ('Resource Injection')	230
ChildOf		913	Improper Control of Dynamically-Managed Code Resources	1585
ParentOf		621	Variable Extraction Error	1230
ParentOf		627	Dynamic Variable Evaluation	1240

**Weakness Ordinalities****Primary** :**Common Consequences**

Scope	Impact	Likelihood
Integrity	Modify Application Data	

Scope	Impact	Likelihood
	<i>An attacker could modify sensitive data or program variables.</i>	
Integrity	Execute Unauthorized Code or Commands	
Other Integrity	Varies by Context Alter Execution Logic	

### Potential Mitigations

#### Phase: Implementation

*Strategy = Input Validation*

For any externally-influenced input, check the input against a white list of internal program variables that are allowed to be modified.

#### Phase: Implementation

#### Phase: Architecture and Design

*Strategy = Refactoring*

Refactor the code so that internal program variables do not need to be dynamically identified.

### Demonstrative Examples

#### Example 1:

This code uses the credentials sent in a POST request to login a user.

*Example Language: PHP*

*(bad)*

```
//Log user in, and set $isAdmin to true if user is an administrator
function login($user,$pass){
    $query = buildQuery($user,$pass);
    mysql_query($query);
    if(getUserRole($user) == "Admin"){
        $isAdmin = true;
    }
}
$isAdmin = false;
extract($_POST);
login(mysql_real_escape_string($user),mysql_real_escape_string($pass));
```

The call to `extract()` will overwrite the existing values of any variables defined previously, in this case `$isAdmin`. An attacker can send a POST request with an unexpected third value "isAdmin" equal to "true", thus gaining Admin privileges.

### Observed Examples

Reference	Description
<b>CVE-2006-7135</b>	extract issue enables file inclusion <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-7135">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-7135</a>
<b>CVE-2006-7079</b>	extract used for register_globals compatibility layer, enables path traversal <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-7079">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-7079</a>
<b>CVE-2007-0649</b>	extract() buried in include files makes post-disclosure analysis confusing; original report had seemed incorrect. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-0649">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-0649</a>

## CWE-915: Improperly Controlled Modification of Dynamically-Determined Object Attributes

<b>Weakness ID</b> : 915	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software receives input from an upstream component that specifies multiple attributes, properties, or fields that are to be initialized or updated in an object, but it does not properly control which attributes can be modified.

### Extended Description

If the object contains attributes that were only intended for internal use, then their unexpected modification could lead to a vulnerability.

This weakness is sometimes known by the language-specific mechanisms that make it possible, such as mass assignment, autobinding, or object injection.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		913	Improper Control of Dynamically-Managed Code Resources	1585
PeerOf		502	Deserialization of Untrusted Data	1069
PeerOf		502	Deserialization of Untrusted Data	1069

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		913	Improper Control of Dynamically-Managed Code Resources	1585

### Weakness Ordinalities

**Primary** :

### Applicable Platforms

**Language** : Ruby (Prevalence = Undetermined)

**Language** : ASP.NET (*Prevalence = Undetermined*)

**Language** : PHP (*Prevalence = Undetermined*)

**Language** : Python (*Prevalence = Undetermined*)

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Alternate Terms

**Mass Assignment** : "Mass assignment" is the name of a feature in Ruby on Rails that allows simultaneous modification of multiple object attributes.

**AutoBinding** : The "Autobinding" term is used in frameworks such as Spring MVC and ASP.NET MVC.

**Object injection** : This term seems to be preferred by some PHP application researchers who attack unsafe use of the unserialize() function.

### Common Consequences

Scope	Impact	Likelihood
Integrity	Modify Application Data <i>An attacker could modify sensitive data or program variables.</i>	
Integrity	Execute Unauthorized Code or Commands	
Other	Varies by Context	
Integrity	Alter Execution Logic	

### Potential Mitigations

#### Phase: Implementation

If available, use features of the language or framework that allow specification of whitelists of attributes or fields that are allowed to be modified. If possible, prefer whitelists over black lists. For applications written with Ruby on Rails, use the `attr_accessible` (whitelist) or `attr_protected` (blacklist) macros in each class that may be used in mass assignment.

#### Phase: Architecture and Design

#### Phase: Implementation

If available, use the signing/sealing features of the programming language to assure that deserialized data has not been tainted. For example, a hash-based message authentication code (HMAC) could be used to ensure that data has not been modified.

#### Phase: Implementation

*Strategy = Input Validation*

For any externally-influenced input, check the input against a white list of internal object attributes or fields that are allowed to be modified.

#### Phase: Implementation

#### Phase: Architecture and Design

*Strategy = Refactoring*

Refactor the code so that object attributes or fields do not need to be dynamically identified, and only expose getter/setter functionality for the intended attributes.

### Observed Examples

Reference	Description
<b>CVE-2012-2054</b>	Mass assignment allows modification of arbitrary attributes using modified URL. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2054">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2054</a>

Reference	Description
<b>CVE-2012-2055</b>	Source version control product allows modification of trusted key using mass assignment. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2055">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2055</a>
<b>CVE-2008-7310</b>	Attackers can bypass payment step in e-commerce software. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-7310">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-7310</a>
<b>CVE-2013-1465</b>	Use of PHP unserialize function on untrusted input allows attacker to modify application configuration. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-1465">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-1465</a>
<b>CVE-2012-3527</b>	Use of PHP unserialize function on untrusted input in content management system might allow code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-3527">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-3527</a>
<b>CVE-2012-0911</b>	Use of PHP unserialize function on untrusted input in content management system allows code execution using a crafted cookie value. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-0911">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-0911</a>
<b>CVE-2012-0911</b>	Content management system written in PHP allows unserialize of arbitrary objects, possibly allowing code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-0911">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-0911</a>
<b>CVE-2011-4962</b>	Content management system written in PHP allows code execution through page comments. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-4962">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-4962</a>
<b>CVE-2009-4137</b>	Use of PHP unserialize function on cookie value allows remote code execution or upload of arbitrary files. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-4137">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-4137</a>
<b>CVE-2007-5741</b>	Content management system written in Python interprets untrusted data as pickles, allowing code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-5741">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-5741</a>
<b>CVE-2011-2520</b>	Python script allows local users to execute code via pickled data. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-2520">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-2520</a>
<b>CVE-2005-2875</b>	Python script allows remote attackers to execute arbitrary code using pickled objects. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2875">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-2875</a>
<b>CVE-2013-0277</b>	Ruby on Rails allows deserialization of untrusted YAML to execute arbitrary code. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-0277">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-0277</a>
<b>CVE-2011-2894</b>	Spring framework allows deserialization of objects from untrusted sources to execute arbitrary code. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-2894">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2011-2894</a>
<b>CVE-2012-1833</b>	Grails allows binding of arbitrary parameters to modify arbitrary object properties. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-1833">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-1833</a>
<b>CVE-2010-3258</b>	Incorrect deserialization in web browser allows escaping the sandbox. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3258">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3258</a>
<b>CVE-2008-1013</b>	Media library allows deserialization of objects by untrusted Java applets, leading to arbitrary code execution. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1013">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1013</a>

## Notes

### Maintenance

The relationships between CWE-502 and CWE-915 need further exploration. CWE-915 is more narrowly scoped to object modification, and is not necessarily used for deserialization.

## CWE-916: Use of Password Hash With Insufficient Computational Effort

**Weakness ID** : 916

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software generates a hash for a password, but it uses a scheme that does not provide a sufficient level of computational effort that would make password cracking attacks infeasible or expensive.

### Extended Description

Many password storage mechanisms compute a hash and store the hash, instead of storing the original password in plaintext. In this design, authentication involves accepting an incoming password, computing its hash, and comparing it to the stored hash.

Many hash algorithms are designed to execute quickly with minimal overhead, even cryptographic hashes. However, this efficiency is a problem for password storage, because it can reduce an attacker's workload for brute-force password cracking. If an attacker can obtain the hashes through some other method (such as SQL injection on a database that stores hashes), then the attacker can store the hashes offline and use various techniques to crack the passwords by computing hashes efficiently. Without a built-in workload, modern attacks can compute large numbers of hashes, or even exhaust the entire space of all possible passwords, within a very short amount

of time, using massively-parallel computing (such as cloud computing) and GPU, ASIC, or FPGA hardware. In such a scenario, an efficient hash algorithm helps the attacker.

There are several properties of a hash scheme that are relevant to its strength against an offline, massively-parallel attack:

- The amount of CPU time required to compute the hash ("stretching")
- The amount of memory required to compute the hash ("memory-hard" operations)
- Including a random value, along with the password, as input to the hash computation ("salting")
- Given a hash, there is no known way of determining an input (e.g., a password) that produces this hash value, other than by guessing possible inputs ("one-way" hashing)
- Relative to the number of all possible hashes that can be generated by the scheme, there is a low likelihood of producing the same hash for multiple different inputs ("collision resistance")

Note that the security requirements for the software may vary depending on the environment and the value of the passwords. Different schemes might not provide all of these properties, yet may still provide sufficient security for the environment. Conversely, a solution might be very strong in preserving one property, which still being very weak for an attack against another property, or it might not be able to significantly reduce the efficiency of a massively-parallel attack.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	<b>B</b>	327	Use of a Broken or Risky Cryptographic Algorithm	719
ParentOf	<b>B</b>	759	Use of a One-Way Hash without a Salt	1395

## Weakness Ordinalities

**Primary :**

## Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Access Control	Bypass Protection Mechanism Gain Privileges or Assume Identity	

Scope	Impact	Likelihood
	<i>If an attacker can gain access to the hashes, then the lack of sufficient computational effort will make it easier to conduct brute force attacks using techniques such as rainbow tables, or specialized hardware such as GPUs, which can be much faster than general-purpose CPUs for computing hashes.</i>	

## Detection Methods

### Automated Static Analysis - Binary or Bytecode

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Bytecode Weakness Analysis - including disassembler + source code weakness analysis Binary Weakness Analysis - including disassembler + source code weakness analysis

*Effectiveness = SOAR Partial*

### Manual Static Analysis - Binary or Bytecode

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Binary / Bytecode disassembler - then use manual analysis for vulnerabilities & anomalies

*Effectiveness = SOAR Partial*

### Manual Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Highly cost effective: Focused Manual Spotcheck - Focused manual analysis of source Manual Source Code Review (not inspections)

*Effectiveness = High*

### Automated Static Analysis - Source Code

According to SOAR, the following detection techniques may be useful: Highly cost effective: Source code Weakness Analyzer Context-configured Source Code Weakness Analyzer

*Effectiveness = High*

### Automated Static Analysis

According to SOAR, the following detection techniques may be useful: Cost effective for partial coverage: Configuration Checker

*Effectiveness = SOAR Partial*

### Architecture or Design Review

According to SOAR, the following detection techniques may be useful: Highly cost effective: Formal Methods / Correct-By-Construction Cost effective for partial coverage: Inspection (IEEE 1028 standard) (can apply to requirements, design, source code, etc.)

*Effectiveness = High*

## Potential Mitigations

### Phase: Architecture and Design

Use an adaptive hash function that can be configured to change the amount of computational effort needed to compute the hash, such as the number of iterations ("stretching") or the amount of memory required. Some hash functions perform salting automatically. These functions can significantly increase the overhead for a brute force attack compared to intentionally-fast functions such as MD5. For example, rainbow table attacks can become infeasible due to the high computing overhead. Finally, since computing power gets faster and cheaper over time, the technique can be reconfigured to increase the workload without forcing an entire replacement of the algorithm in use. Some hash functions that have one or more of these desired properties

include bcrypt [REF-291], scrypt [REF-292], and PBKDF2 [REF-293]. While there is active debate about which of these is the most effective, they are all stronger than using salts with hash functions with very little computing overhead. Note that using these functions can have an impact on performance, so they require special consideration to avoid denial-of-service attacks. However, their configurability provides finer control over how much CPU and memory is used, so it could be adjusted to suit the environment's needs.

*Effectiveness = High*

#### Phase: Implementation

#### Phase: Architecture and Design

When using industry-approved techniques, use them correctly. Don't cut corners by skipping resource-intensive steps (CWE-325). These steps are often essential for preventing common attacks.

#### Observed Examples

Reference	Description
<b>CVE-2008-1526</b>	Router does not use a salt with a hash, making it easier to crack passwords. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1526">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-1526</a>
<b>CVE-2006-1058</b>	Router does not use a salt with a hash, making it easier to crack passwords. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1058">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2006-1058</a>
<b>CVE-2008-4905</b>	Blogging software uses a hard-coded salt when calculating a password hash. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4905">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4905</a>
<b>CVE-2002-1657</b>	Database server uses the username for a salt when encrypting passwords, simplifying brute force attacks. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1657">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1657</a>
<b>CVE-2001-0967</b>	Server uses a constant salt when encrypting passwords, simplifying brute force attacks. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-0967">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-0967</a>
<b>CVE-2005-0408</b>	chain: product generates predictable MD5 hashes using a constant value combined with username, allowing authentication bypass. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0408">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0408</a>

## CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection')

<b>Weakness ID</b> : 917	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software constructs all or part of an expression language (EL) statement in a Java Server Page (JSP) using externally-influenced input from an upstream component, but it does not neutralize or incorrectly neutralizes special elements that could modify the intended EL statement before it is executed.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	140

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	140

### Weakness Ordinalities

**Primary** :

### Applicable Platforms

### Alternate Terms

**EL Injection** :

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data	

Scope	Impact	Likelihood
Integrity	Execute Unauthorized Code or Commands	

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	V	Page
MemberOf	C	1027	OWASP Top Ten 2017 Category A1 - Injection	1026	1856

### Notes

#### Relationship

In certain versions of Spring 3.0.5 and earlier, there was a vulnerability (CVE-2011-2730) in which Expression Language tags would be evaluated twice, which effectively exposed any application to EL injection. However, even for later versions, this weakness is still possible depending on configuration.

## CWE-918: Server-Side Request Forgery (SSRF)

<b>Weakness ID</b> : 918	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The web server receives a URL or similar request from an upstream component and retrieves the contents of this URL, but it does not sufficiently ensure that the request is being sent to the expected destination.

### Extended Description

By providing URLs to unexpected hosts or ports, attackers can make it appear that the server is sending the request, possibly bypassing access controls such as firewalls that prevent the attackers from accessing the URLs directly. The server can be used as a proxy to conduct port scanning of hosts in internal networks, use other URLs such as that can access documents on the system (using file://), or use other protocols such as gopher:// or tftp://, which may provide greater control over the contents of requests.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
MemberOf		442	Web Problems	1748
ChildOf		441	Unintended Proxy or Intermediary ('Confused Deputy')	949

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Paradigm** : Web Based (*Prevalence = Undetermined*)

**Technology** : Web Server (*Prevalence = Undetermined*)

### Alternate Terms

**XSPA** : Cross Site Port Attack

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data	
Integrity	Execute Unauthorized Code or Commands	

### Observed Examples

Reference	Description
<b>CVE-2002-1484</b>	Web server allows attackers to request a URL from another server, including other ports, which allows proxied scanning. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1484">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2002-1484</a>
<b>CVE-2004-2061</b>	CGI script accepts and retrieves incoming URLs. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-2061">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2004-2061</a>
<b>CVE-2010-1637</b>	Web-based mail program allows internal network scanning using a modified POP3 port number. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-1637">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-1637</a>
<b>CVE-2009-0037</b>	URL-downloading library automatically follows redirects to file:// and scp:// URLs <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0037">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2009-0037</a>

### Notes

#### Relationship

CWE-918 (SSRF) and CWE-611 (XXE) are closely related, because they both involve web-related technologies and can launch outbound requests to unexpected destinations. However, XXE can be performed client-side, or in other contexts in which the software is not acting directly as a server, so the "Server" portion of the SSRF acronym does not necessarily apply.

## CWE-920: Improper Restriction of Power Consumption

**Weakness ID** : 920

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software operates in an environment in which power is a limited resource that cannot be automatically replenished, but the software does not properly restrict the amount of power that its operation consumes.

### Extended Description

In environments such as embedded or mobile devices, power can be a limited resource such as a battery, which cannot be automatically replenished by the software itself, and the device might not always be directly attached to a reliable power source. If the software uses too much power too quickly, then this could cause the device (and subsequently, the software) to stop functioning until power is restored, or increase the financial burden on the device owner because of increased power costs.

Normal operation of an application will consume power. However, in some cases, an attacker could cause the application to consume more power than intended, using components such as:

- Display
- CPU
- Disk I/O
- GPS
- Sound
- Microphone
- USB interface

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**Paradigm** : Mobile (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Availability	DoS: Resource Consumption (Other) DoS: Crash, Exit, or Restart  <i>The power source could be drained, causing the application - and the entire device - to cease functioning.</i>	

## CWE-921: Storage of Sensitive Data in a Mechanism without Access Control

**Weakness ID** : 921

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The software stores sensitive information in a file system or device that does not have built-in access control.

### Extended Description

While many modern file systems or devices utilize some form of access control in order to restrict access to data, not all storage mechanisms have this capability. For example, memory cards, floppy disks, CDs, and USB devices are typically made accessible to any user within the system. This can become a problem when sensitive data is stored in these mechanisms in a multi-user environment, because anybody on the system can read or write this data.

On Android devices, external storage is typically globally readable and writable by other applications on the device. External storage may also be easily accessible through the mobile device's USB connection or physically accessible through the device's memory card port.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-922: Insecure Storage of Sensitive Information

**Weakness ID** : 922

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Class

### Description

The software stores sensitive information without properly limiting read or write access by unauthorized actors.

### Extended Description

If read access is not properly restricted, then attackers can steal the sensitive information. If write access is not properly restricted, then attackers can modify and possibly delete the data, causing incorrect results and possibly a denial of service.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

ParentOf		312	Cleartext Storage of Sensitive Information	692
ParentOf		921	Storage of Sensitive Data in a Mechanism without Access Control	1599

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data Read Files or Directories  <i>Attackers can read sensitive information by accessing the unrestricted storage mechanism.</i>	
Integrity	Modify Application Data Modify Files or Directories  <i>Attackers can read sensitive information by accessing the unrestricted storage mechanism.</i>	

### Notes

#### Relationship

There is an overlapping relationship between insecure storage of sensitive information (CWE-922) and missing encryption of sensitive information (CWE-311). Encryption is often used to prevent an attacker from reading the sensitive data. However, encryption does not prevent the attacker from erasing or overwriting the data.

#### Maintenance

This is a high-level node that includes children from various parts of the CWE research view (CWE-1000). Currently, most of the information is in these child entries. This entry will be made more comprehensive in later CWE versions.

## CWE-923: Improper Restriction of Communication Channel to Intended Endpoints

<b>Weakness ID</b> : 923	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The software establishes a communication channel to (or from) an endpoint for privileged or protected operations, but it does not properly ensure that it is communicating with the correct endpoint.

### Extended Description

Attackers might be able to spoof the intended endpoint from a different system or process, thus gaining the same level of access as the intended endpoint.

While this issue frequently involves authentication between network-based clients and servers, other types of communication channels and endpoints can have this weakness.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-925: Improper Verification of Intent by Broadcast Receiver

<b>Weakness ID</b> : 925	<b>Status</b> : Incomplete
--------------------------	----------------------------

**Structure** : Simple**Abstraction** : Variant

## Description

The Android application uses a Broadcast Receiver that receives an Intent but does not properly verify that the Intent came from an authorized source.

## Extended Description

Certain types of Intents, identified by action string, can only be broadcast by the operating system itself, not by third-party applications. However, when an application registers to receive these implicit system intents, it is also registered to receive any explicit intents. While a malicious application cannot send an implicit system intent, it can send an explicit intent to the target application, which may assume that any received intent is a valid implicit system intent and not an explicit intent from another application. This may lead to unintended behavior.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1601

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1601

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Paradigm** : Mobile (*Prevalence = Undetermined*)

## Alternate Terms

**Intent Spoofing** :

## Common Consequences

Scope	Impact	Likelihood
Integrity	Gain Privileges or Assume Identity <i>Another application can impersonate the operating system and cause the software to perform an unintended action.</i>	

## Potential Mitigations

### Phase: Architecture and Design

Before acting on the Intent, check the Intent Action to make sure it matches the expected System action.

## Demonstrative Examples

### Example 1:

The following example demonstrates the weakness.

*Example Language: XML*

*(bad)*

```
<manifest package="com.example.vulnerableApplication">
```

```

<application>
...
  <receiver android:name=".ShutdownReceiver">
    <intent-filter>
      <action android:name="android.intent.action.ACTION_SHUTDOWN" />
    </intent-filter>
  </receiver>
...
</application>
</manifest>

```

The ShutdownReceiver class will handle the intent:

*Example Language: Java*

*(bad)*

```

...
IntentFilter filter = new IntentFilter(Intent.ACTION_SHUTDOWN);
BroadcastReceiver sReceiver = new ShutDownReceiver();
registerReceiver(sReceiver, filter);
...
public class ShutdownReceiver extends BroadcastReceiver {
  @Override
  public void onReceive(final Context context, final Intent intent) {
    mainActivity.saveLocalData();
    mainActivity.stopActivity();
  }
}

```

Because the method does not confirm that the intent action is the expected system intent, any received intent will trigger the shutdown procedure, as shown here:

*Example Language: Java*

*(attack)*

```

window.location = examplescheme://method?parameter=value

```

An attacker can use this behavior to cause a denial of service.

## Notes

### Maintenance

This entry will be made more comprehensive in later CWE versions.

## Related Attack Patterns

CAPEC-ID	Attack Pattern Name
499	Intent Intercept

## CWE-926: Improper Export of Android Application Components

**Weakness ID :** 926

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Variant

## Description

The Android application exports a component for use by other applications, but does not properly restrict which applications can launch the component or access the data it contains.

## Extended Description

The attacks and consequences of improperly exporting a component may depend on the exported component:

- If access to an exported Activity is not restricted, any application will be able to launch the activity. This may allow a malicious application to gain access to sensitive information, modify the internal state of the application, or trick a user into interacting with the victim application while believing they are still interacting with the malicious application.
- If access to an exported Service is not restricted, any application may start and bind to the Service. Depending on the exposed functionality, this may allow a malicious application to perform unauthorized actions, gain access to sensitive information, or corrupt the internal state of the application.
- If access to a Content Provider is not restricted to only the expected applications, then malicious applications might be able to access the sensitive data. Note that in Android before 4.2, the Content Provider is automatically exported unless it has been explicitly declared as NOT exported.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		285	Improper Authorization	622

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		285	Improper Authorization	622

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Paradigm** : Mobile (*Prevalence = Undetermined*)

## Background Details

There are three types of components that can be exported in an Android application.

### Activity

An Activity is an application component that provides a UI for users to interact with. A typical application will have multiple Activity screens that perform different functions, such as a main Activity screen and a separate settings Activity screen.

### Service

A Service is an application component that is started by another component to execute an operation in the background, even after the invoking component is terminated. Services do not have a UI component visible to the user.

### Content Provider

The Content Provider mechanism can be used to share data with other applications or internally within the same application.

## Common Consequences

Scope	Impact	Likelihood
Availability Integrity	Unexpected State DoS: Crash, Exit, or Restart DoS: Instability Varies by Context  <i>Other applications, possibly untrusted, can launch the Activity.</i>	
Availability Integrity	Unexpected State Gain Privileges or Assume Identity DoS: Crash, Exit, or Restart DoS: Instability Varies by Context  <i>Other applications, possibly untrusted, can bind to the Service.</i>	
Confidentiality Integrity	Read Application Data Modify Application Data  <i>Other applications, possibly untrusted, can read or modify the data that is offered by the Content Provider.</i>	

## Potential Mitigations

### Phase: Build and Compilation

*Strategy = Attack Surface Reduction*

If they do not need to be shared by other applications, explicitly mark components with `android:exported="false"` in the application manifest.

### Phase: Build and Compilation

*Strategy = Attack Surface Reduction*

If you only intend to use exported components between related apps under your control, use `android:protectionLevel="signature"` in the xml manifest to restrict access to applications signed by you.

### Phase: Build and Compilation

#### Phase: Architecture and Design

*Strategy = Attack Surface Reduction*

Limit Content Provider permissions (read/write) as appropriate.

### Phase: Build and Compilation

#### Phase: Architecture and Design

*Strategy = Separation of Privilege*

Limit Content Provider permissions (read/write) as appropriate.

## Demonstrative Examples

### Example 1:

This application is exporting an activity and a service in its manifest.xml:

*Example Language: XML*

*(bad)*

```
<activity android:name="com.example.vulnerableApp.mainScreen">
...
<intent-filter>
<action android:name="com.example.vulnerableApp.OPEN_UI" />
```

```

    <category android:name="android.intent.category.DEFAULT" />
  </intent-filter>
  ...
</activity>
<service android:name="com.example.vulnerableApp.backgroundService">
  ...
  <intent-filter>
    <action android:name="com.example.vulnerableApp.START_BACKGROUND" />
  </intent-filter>
  ...
</service>

```

Because these components have intent filters but have not explicitly set 'android:exported=false' elsewhere in the manifest, they are automatically exported so that any other application can launch them. This may lead to unintended behavior or exploits.

### Example 2:

This application has created a content provider to enable custom search suggestions within the application:

*Example Language: XML*

*(bad)*

```

<provider>
  android:name="com.example.vulnerableApp.searchDB"
  android:authorities="com.example.vulnerableApp.searchDB">
</provider>

```

Because this content provider is only intended to be used within the application, it does not need to be exported. However, in Android before 4.2, it is automatically exported thus potentially allowing malicious applications to access sensitive information.

## CWE-927: Use of Implicit Intent for Sensitive Communication

**Weakness ID** : 927

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Variant

### Description

The Android application uses an implicit intent for transmitting sensitive data to other applications.

### Extended Description

Since an implicit intent does not specify a particular application to receive the data, any application can process the intent by using an Intent Filter for that intent. This can allow untrusted applications to obtain sensitive data. There are two variations on the standard broadcast intent, ordered and sticky.

Ordered broadcast intents are delivered to a series of registered receivers in order of priority as declared by the Receivers. A malicious receiver can give itself a high priority and cause a denial of service by stopping the broadcast from propagating further down the chain. There is also the possibility of malicious data modification, as a receiver may also alter the data within the Intent before passing it on to the next receiver. The downstream components have no way of asserting that the data has not been altered earlier in the chain.

Sticky broadcast intents remain accessible after the initial broadcast. An old sticky intent will be broadcast again to any new receivers that register for it in the future, greatly increasing the chances of information exposure over time. Also, sticky broadcasts cannot be protected by permissions that may apply to other kinds of intents.

In addition, any broadcast intent may include a URI that references data that the receiving component does not normally have the privileges to access. The sender of the intent can include special privileges that grant the receiver read or write access to the specific URI included in the intent. A malicious receiver that intercepts this intent will also gain those privileges and be able to read or write the resource at the specified URI.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

ChildOf		285	Improper Authorization	622

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Paradigm** : Mobile (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data  <i>Other applications, possibly untrusted, can read the data that is offered through the Intent.</i>	
Integrity	Varies by Context  <i>The application may handle responses from untrusted applications on the device, which could cause it to perform unexpected or unauthorized actions.</i>	

## Potential Mitigations

### Phase: Implementation

If the application only requires communication with its own components, then the destination is always known, and an explicit intent could be used.

## Demonstrative Examples

### Example 1:

This application wants to create a user account in several trusted applications using one broadcast intent:

*Example Language: Java*

*(bad)*

```
Intent intent = new Intent();
intent.setAction("com.example.CreateUser");
intent.putExtra("Username", uname_string);
```

```
intent.putExtra("Password", pw_string);
sendBroadcast(intent);
```

This application assumes only the trusted applications will be listening for the action. A malicious application can register for this action and intercept the user's login information, as below:

Example Language: Java

(attack)

```
IntentFilter filter = new IntentFilter("com.example.CreateUser");
MyReceiver receiver = new MyReceiver();
registerReceiver(receiver, filter);
```

When a broadcast contains sensitive information, create a whitelist of applications that can receive the action using the application's manifest file, or programmatically send the intent to each individual intended receiver.

### Example 2:

This application interfaces with a web service that requires a separate user login. It creates a sticky intent, so that future trusted applications that also use the web service will know who the current user is:

Example Language: Java

(bad)

```
Intent intent = new Intent();
intent.setAction("com.example.service.UserExists");
intent.putExtra("Username", uname_string);
sendStickyBroadcast(intent);
```

Example Language: Java

(attack)

```
IntentFilter filter = new IntentFilter("com.example.service.UserExists");
MyReceiver receiver = new MyReceiver();
registerReceiver(receiver, filter);
```

Sticky broadcasts can be read by any application at any time, and so should never contain sensitive information such as a username.

### Example 3:

This application is sending an ordered broadcast, asking other applications to open a URL:

Example Language: Java

(bad)

```
Intent intent = new Intent();
intent.setAction("com.example.OpenURL");
intent.putExtra("URL_TO_OPEN", url_string);
sendOrderedBroadcastAsUser(intent);
```

Any application in the broadcast chain may alter the data within the intent. This malicious application is altering the URL to point to an attack site:

Example Language: Java

(attack)

```
public class CallReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        String url = intent.getStringExtra(Intent.URL_TO_OPEN);
        attackURL = "www.example.com/attack?" + url;
        setResultData(attackURL);
    }
}
```

The final receiving application will then open the attack URL. Where possible, send intents to specific trusted applications instead of using a broadcast chain.

#### Example 4:

This application sends a special intent with a flag that allows the receiving application to read a data file for backup purposes.

Example Language: Java

(bad)

```
Intent intent = new Intent();
intent.setAction("com.example.BackupUserData");
intent.setData(file_uri);
intent.addFlags(FLAG_GRANT_READ_URI_PERMISSION);
sendBroadcast(intent);
```

Example Language: Java

(attack)

```
public class CallReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        Uri userData = intent.getData();
        stealUserData(userData);
    }
}
```

Any malicious application can register to receive this intent. Because of the FLAG\_GRANT\_READ\_URI\_PERMISSION included with the intent, the malicious receiver code can read the user's data.

#### Notes

##### Maintenance

This entry will be made more comprehensive in later CWE versions.

## CWE-939: Improper Authorization in Handler for Custom URL Scheme

Weakness ID : 939

Status: Incomplete

Structure : Simple

Abstraction : Base

#### Description

The software uses a handler for a custom URL scheme, but it does not properly restrict which actors can invoke the handler using the scheme.

#### Extended Description

Mobile platforms and other architectures allow the use of custom URL schemes to facilitate communication between applications. In the case of iOS, this is the only method to do inter-application communication. The implementation is at the developer's discretion which may open security flaws in the application. An example could be potentially dangerous functionality such as modifying files through a custom URL scheme.

#### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		862	Missing Authorization	1564

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1011	Authorize Actors	1846

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		862	Missing Authorization	1564

### Applicable Platforms

**Paradigm** : Mobile (*Prevalence = Undetermined*)

### Potential Mitigations

#### Phase: Architecture and Design

Utilize a user prompt pop-up to authorize potentially harmful actions such as those modifying data or dealing with sensitive information. When designing functionality of actions in the URL scheme, consider whether the action should be accessible to all mobile applications, or if a whitelist of applications to interface with is appropriate.

### Demonstrative Examples

#### Example 1:

This iOS application uses a custom URL scheme. The replaceFileText action in the URL scheme allows an external application to interface with the file incomingMessage.txt and replace the contents with the text field of the query string.

External Application

*Example Language: Objective-C*

*(good)*

```
NSString *stringURL = @"appscheme://replaceFileText?file=incomingMessage.txt&text=hello";
NSURL *url = [NSURL URLWithString:stringURL];
[[UIApplication sharedApplication] openURL:url];
```

Application URL Handler

*Example Language:*

*(bad)*

```
-(BOOL)application:(UIApplication *)application handleOpenURL:(NSURL *)url {
    if (!url) {
        return NO;
    }
    NSString *action = [url host];
    if([action isEqualToString: @"replaceFileText"]) {
        NSDictionary *dict = [self parseQueryStringExampleFunction:[url query]];
        //this function will write contents to a specified file
        FileObject *objectFile = [self writeToFile:[dict objectForKey: @"file"] withText:[dict objectForKey: @"text"]];
    }
    return YES;
}
```

The handler has no restriction on who can use its functionality. The handler can be invoked using any method that invokes the URL handler such as the following malicious iframe embedded on a web page opened by Safari.

Example Language: HTML

(attack)

```
<iframe src="appscheme://replaceFileText?file=Bookmarks.dat&text=listOfMaliciousWebsites">
```

The attacker can host a malicious website containing the iframe and trick users into going to the site via a crafted phishing email. Since Safari automatically executes iframes, the user is not prompted when the handler executes the iframe code which automatically invokes the URL handler replacing the bookmarks file with a list of malicious websites. Since `replaceFileText` is a potentially dangerous action, an action that modifies data, there should be a sanity check before the `writeToFile:withText:` function.

### Example 2:

These Android and iOS applications intercept URL loading and perform special actions if a particular URL scheme is used, thus allowing the Javascript within the WebView to communicate with the application:

Example Language: Java

(bad)

```
@Override
public boolean shouldOverrideUrlLoading(WebView view, String url){
    if (url.substring(0,14).equalsIgnoreCase("examplescheme:")){
        if(url.substring(14,25).equalsIgnoreCase("getUserInfo")){
            writeToView(view, UserData);
            return false;
        }
        else{
            return true;
        }
    }
}
```

Example Language: Objective-C

(bad)

```
-(BOOL) webView:(UIWebView *)exWebView shouldStartLoadWithRequest:(NSURLRequest *)exRequest navigationType:
(UIWebViewNavigationType)exNavigationType
{
    NSURL *URL = [exRequest URL];
    if ([[URL scheme] isEqualToString:@"exampleScheme"])
    {
        NSString *functionString = [URL resourceSpecifier];
        if ([functionString hasPrefix:@"specialFunction"])
        {
            // Make data available back in webview.
            UIWebView *webView = [self writeToView:[URL query]];
        }
        return NO;
    }
    return YES;
}
```

A call into native code can then be initiated by passing parameters within the URL:

Example Language: JavaScript

(attack)

```
window.location = examplescheme://method?parameter=value
```

Because the application does not check the source, a malicious website loaded within this WebView has the same access to the API as a trusted site.

## Observed Examples

Reference	Description
CVE-2013-5725	URL scheme has action replace which requires no user prompt and allows remote attackers to perform undesired actions. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5725">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5725</a>
CVE-2013-5726	URL scheme has action follow and favorite which allows remote attackers to force user to perform undesired actions. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5726">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5726</a>

## References

## CWE-940: Improper Verification of Source of a Communication Channel

<b>Weakness ID</b> : 940	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The software establishes a communication channel to handle an incoming request that has been initiated by an actor, but it does not properly verify that the request is coming from the expected origin.

## Extended Description

When an attacker can successfully establish a communication channel from an untrusted origin, the attacker may be able to gain privileges and access unexpected functionality.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1601

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1014	Identify Actors	1850

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1601

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Paradigm** : Mobile (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Access Control	Gain Privileges or Assume Identity	
Other	Varies by Context	
<i>An attacker can access any functionality that is inadvertently accessible to the source.</i>		

## Potential Mitigations

### Phase: Architecture and Design

Use a mechanism that can validate the identity of the source, such as a certificate, and validate the integrity of data to ensure that it cannot be modified in transit using a man-in-the-middle attack. When designing functionality of actions in the URL scheme, consider whether the action should be accessible to all mobile applications, or if a whitelist of applications to interface with is appropriate.

## Demonstrative Examples

### Example 1:

This Android application will remove a user account when it receives an intent to do so:

*Example Language: Java*

*(bad)*

```
IntentFilter filter = new IntentFilter("com.example.RemoveUser");
MyReceiver receiver = new MyReceiver();
registerReceiver(receiver, filter);
public class DeleteReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(Context context, Intent intent) {
        int userID = intent.getIntExtra("userID");
        destroyUserData(userID);
    }
}
```

This application does not check the origin of the intent, thus allowing any malicious application to remove a user. Always check the origin of an intent, or create a whitelist of trusted applications using the manifest.xml file.

### Example 2:

These Android and iOS applications intercept URL loading within a WebView and perform special actions if a particular URL scheme is used, thus allowing the Javascript within the WebView to communicate with the application:

*Example Language: Java*

*(bad)*

```
// Android
@Override
public boolean shouldOverrideUrlLoading(WebView view, String url){
    if (url.substring(0,14).equalsIgnoreCase("examplescheme:")){
        if(url.substring(14,25).equalsIgnoreCase("getUserInfo")){
            writeToView(view, UserData);
            return false;
        }
        else{
            return true;
        }
    }
}
```

*Example Language: Objective-C*

*(bad)*

```
// iOS
```

```

-(BOOL) webView:(UIWebView *)exWebView shouldStartLoadWithRequest:(NSURLRequest *)exRequest navigationType:
(UIWebViewNavigationType)exNavigationType
{
    NSURL *URL = [exRequest URL];
    if ([[URL scheme] isEqualToString:@"exampleScheme"])
    {
        NSString *functionString = [URL resourceSpecifier];
        if ([functionString hasPrefix:@"specialFunction"])
        {
            // Make data available back in webview.
            UIWebView *webView = [self writeDataToView:[URL query]];
        }
        return NO;
    }
    return YES;
}

```

A call into native code can then be initiated by passing parameters within the URL:

Example Language: JavaScript

(attack)

```
window.location = examplescheme://method?parameter=value
```

Because the application does not check the source, a malicious website loaded within this WebView has the same access to the API as a trusted site.

### Observed Examples

Reference	Description
<b>CVE-2000-1218</b>	DNS server can accept DNS updates from hosts that it did not query, leading to cache poisoning <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2000-1218">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2000-1218</a>
<b>CVE-2005-0877</b>	DNS server can accept DNS updates from hosts that it did not query, leading to cache poisoning <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0877">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2005-0877</a>
<b>CVE-2001-1452</b>	DNS server caches glue records received from non-delegated name servers <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1452">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2001-1452</a>

### Notes

#### Relationship

While many access control issues involve authenticating the user, this weakness is more about authenticating the actual source of the communication channel itself; there might not be any "user" in such cases.

### References

[REF-324]Taimur Aslam. "A Taxonomy of Security Faults in the UNIX Operating System". 1995 August 1. < <http://cwe.mitre.org/documents/sources/ATaxonomyofSecurityFaultsintheUNIXOperatingSystem%5BAslam95%5D.pdf> >.

## CWE-941: Incorrectly Specified Destination in a Communication Channel

Weakness ID : 941

Status: Incomplete

Structure : Simple

Abstraction : Base

### Description

The software creates a communication channel to initiate an outgoing request to an actor, but it does not correctly specify the intended destination for that actor.

## Extended Description

Attackers at the destination may be able to spoof trusted servers to steal data or cause a denial of service.

There are at least two distinct weaknesses that can cause the software to communicate with an unintended destination:

- If the software allows an attacker to control which destination is specified, then the attacker can cause it to connect to an untrusted or malicious destination. For example, because UDP is a connectionless protocol, UDP packets can be spoofed by specifying a false source address in the packet; when the server receives the packet and sends a reply, it will specify a destination by using the source of the incoming packet - i.e., the false source. The server can then be tricked into sending traffic to the wrong host, which is effective for hiding the real source of an attack and for conducting a distributed denial of service (DDoS). As another example, server-side request forgery (SSRF) and XML External Entity (XXE) can be used to trick a server into making outgoing requests to hosts that cannot be directly accessed by the attacker due to firewall restrictions.
- If the software incorrectly specifies the destination, then an attacker who can control this destination might be able to spoof trusted servers. While the most common occurrence is likely due to misconfiguration by an administrator, this can be resultant from other weaknesses. For example, the software might incorrectly parse an e-mail or IP address and send sensitive data to an unintended destination. As another example, an Android application may use a "sticky broadcast" to communicate with a receiver for a particular application, but since sticky broadcasts can be processed by *any* receiver, this can allow a malicious application to access restricted data that was only intended for a different application.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1601
CanPrecede		406	Insufficient Control of Network Message Volume (Network Amplification)	883

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1014	Identify Actors	1850

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		923	Improper Restriction of Communication Channel to Intended Endpoints	1601

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Paradigm** : Mobile (*Prevalence = Undetermined*)

## Demonstrative Examples

**Example 1:**

This code listens on a port for DNS requests and sends the result to the requesting address.

Example Language: Python

(bad)

```
sock = socket.socket(socket.AF_INET, socket.SOCK_DGRAM)
sock.bind( (UDP_IP,UDP_PORT) )
while true:
    data = sock.recvfrom(1024)
    if not data:
        break
    (requestIP, nameToResolve) = parseUDPpacket(data)
    record = resolveName(nameToResolve)
    sendResponse(requestIP,record)
```

This code sends a DNS record to a requesting IP address. UDP allows the source IP address to be easily changed ('spoofed'), thus allowing an attacker to redirect responses to a target, which may be then be overwhelmed by the network traffic.

**Observed Examples**

Reference	Description
<b>CVE-2013-5211</b>	composite: NTP feature generates large responses (high amplification factor) with spoofed UDP source addresses. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5211">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-5211</a>
<b>CVE-1999-0513</b>	Classic "Smurf" attack, using spoofed ICMP packets to broadcast addresses. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-0513">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-0513</a>
<b>CVE-1999-1379</b>	DNS query with spoofed source address causes more traffic to be returned to spoofed address than was sent by the attacker. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1379">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-1999-1379</a>

**Notes****Maintenance**

**CWE-942: Overly Permissive Cross-domain Whitelist**

**Weakness ID** : 942

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Variant

**Description**

The software uses a cross-domain policy file that includes domains that should not be trusted.

**Extended Description**

A cross-domain policy file ("crossdomain.xml" in Flash and "clientaccesspolicy.xml" in Silverlight) defines a whitelist of domains from which a server is allowed to make cross-domain requests.

When making a cross-domain request, the Flash or Silverlight client will first look for the policy file

on the target server. If it is found, and the domain hosting the application is explicitly allowed to make requests, the request is made.

Therefore, if a cross-domain policy file includes domains that should not be trusted, such as when using wildcards, then the application could be attacked by these untrusted domains.

An overly permissive policy file allows many of the same attacks seen in Cross-Site Scripting (CWE-79). Once the user has executed a malicious Flash or Silverlight application, they are vulnerable to a variety of attacks. The attacker could transfer private information, such as cookies that may include session information, from the victim's machine to the attacker. The attacker could send malicious requests to a web site on behalf of the victim, which could be especially dangerous to the site if the victim has administrator privileges to manage that site.

In many cases, the attack can be launched without the victim even being aware of it.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		183	Permissive Whitelist	432
ChildOf		668	Exposure of Resource to Wrong Sphere	1304
ChildOf		284	Improper Access Control	619

*Relevant to the view "Architectural Concepts" (CWE-1008)*

Nature	Type	ID	Name	Page
MemberOf		1011	Authorize Actors	1846

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		284	Improper Access Control	619

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Paradigm** : Web Based (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Execute Unauthorized Code or Commands	
Integrity	Bypass Protection Mechanism	
Availability	Read Application Data	
Access Control	Varies by Context	
<p><i>An attacker may be able to bypass the web browser's same-origin policy. An attacker can exploit the weakness to manipulate or steal cookies, create requests that can be mistaken for those of a valid user, compromise confidential information, or execute malicious code on the end user systems for a variety of nefarious purposes. Other damaging attacks include the disclosure of end user files, installation of Trojan horse programs, redirecting the user to some other page or site, running ActiveX controls (under Microsoft Internet Explorer) from sites that a user</i></p>		

Scope	Impact	Likelihood
	<i>perceives as trustworthy, and modifying presentation of content.</i>	

## Potential Mitigations

### Phase: Architecture and Design

*Strategy = Attack Surface Reduction*

Avoid using wildcards in the cross-domain policy file. Any domain matching the wildcard expression will be implicitly trusted, and can perform two-way interaction with the target server.

### Phase: Architecture and Design

#### Phase: Operation

*Strategy = Environment Hardening*

For Flash, modify crossdomain.xml to use meta-policy options such as 'master-only' or 'none' to reduce the possibility of an attacker planting extraneous cross-domain policy files on a server.

### Phase: Architecture and Design

#### Phase: Operation

*Strategy = Attack Surface Reduction*

For Flash, modify crossdomain.xml to use meta-policy options such as 'master-only' or 'none' to reduce the possibility of an attacker planting extraneous cross-domain policy files on a server.

## Demonstrative Examples

### Example 1:

These cross-domain policy files mean to allow Flash and Silverlight applications hosted on other domains to access its data:

Flash crossdomain.xml :

*Example Language: XML*

*(bad)*

```
<cross-domain-policy xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="http://www.adobe.com/xml/schemas/PolicyFile.xsd">
<allow-access-from domain="*.example.com"/>
<allow-access-from domain="*" />
</cross-domain-policy>
```

Silverlight clientaccesspolicy.xml :

*Example Language: XML*

*(bad)*

```
<?xml version="1.0" encoding="utf-8"?>
<access-policy>
<cross-domain-access>
<policy>
<allow-from http-request-headers="SOAPAction">
<domain uri="*" />
</allow-from>
<grant-to>
<resource path="/" include-subpaths="true"/>
</grant-to>
</policy>
</cross-domain-access>
</access-policy>
```

These entries are far too permissive, allowing any Flash or Silverlight application to send requests. A malicious application hosted on any other web site will be able to send requests on behalf of any user tricked into executing it.

## Observed Examples

Reference	Description
<b>CVE-2012-2292</b>	Product has a Silverlight cross-domain policy that does not restrict access to another application, which allows remote attackers to bypass the Same Origin Policy. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2292">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2012-2292</a>
<b>CVE-2014-2049</b>	The default Flash Cross Domain policies in a product allows remote attackers to access user files. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2049">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2049</a>
<b>CVE-2007-6243</b>	Chain: Adobe Flash Player does not sufficiently restrict the interpretation and usage of cross-domain policy files, which makes it easier for remote attackers to conduct cross-domain and cross-site scripting (XSS) attacks. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6243">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2007-6243</a>
<b>CVE-2008-4822</b>	Chain: Adobe Flash Player and earlier does not properly interpret policy files, which allows remote attackers to bypass a non-root domain policy. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4822">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2008-4822</a>
<b>CVE-2010-3636</b>	Chain: Adobe Flash Player does not properly handle unspecified encodings during the parsing of a cross-domain policy file, which allows remote web servers to bypass intended access restrictions via unknown vectors. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3636">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2010-3636</a>

**CWE-943: Improper Neutralization of Special Elements in Data Query Logic****Weakness ID** : 943**Status**: Incomplete**Structure** : Simple**Abstraction** : Class**Description**

The application generates a query intended to access or manipulate data in a data store such as a database, but it does not neutralize or incorrectly neutralizes special elements that can modify the intended logic of the query.

**Extended Description**

Depending on the capabilities of the query language, an attacker could inject additional logic into the query to:

- Modify the intended selection criteria, thus changing which data entities (e.g., records) are returned, modified, or otherwise manipulated

- Append additional commands to the query
- Return more entities than intended
- Return fewer entities than intended
- Cause entities to be sorted in an unexpected way

The ability to execute additional commands or change which entities are returned has obvious risks. But when the application logic depends on the order or number of entities, this can also lead to vulnerabilities. For example, if the application query expects to return only one entity that specifies an administrative user, but an attacker can change which entities are returned, this could cause the logic to return information for a regular user and incorrectly assume that the user has administrative privileges.

While this weakness is most commonly associated with SQL injection, there are many other query languages that are also subject to injection attacks, including HTSQL, LDAP, DQL, XQuery, Xpath, and "NoSQL" languages.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Confidentiality	Bypass Protection Mechanism	
Integrity	Read Application Data	
Availability	Modify Application Data	
Access Control	Varies by Context	

### Observed Examples

Reference	Description
<b>CVE-2014-2503</b>	Injection using Documentum Query Language (DQL) <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2503">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2503</a>
<b>CVE-2014-2508</b>	Injection using Documentum Query Language (DQL) <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2508">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-2508</a>

### MemberOf Relationships

This MemberOf relationships table shows additional CWE Categories and Views that reference this weakness as a member. This information is often useful in understanding where a weakness fits within the context of external information sources.

Nature	Type	ID	Name	<input checked="" type="checkbox"/>	Page
MemberOf	<b>C</b>	1027	OWASP Top Ten 2017 Category A1 - Injection	1026	1856

### Notes

#### Relationship

It could be argued that data query languages are effectively a command language - albeit with a limited set of commands - and thus any query-language injection issue could be treated as a child of CWE-74. However, CWE-943 is intended to better organize query-oriented issues to separate them from fully-functioning programming languages, and also to provide a more precise identifier for the many query languages that do not have their own CWE identifier.

#### Maintenance

This entry will be made more comprehensive in future CWE versions.

## CWE-1004: Sensitive Cookie Without 'HttpOnly' Flag

<b>Weakness ID</b> : 1004	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

### Description

The software uses a cookie to store sensitive information, but the cookie is not marked with the HttpOnly flag.

### Extended Description

The HttpOnly flag directs compatible browsers to prevent client-side script from accessing cookies. Including the HttpOnly flag in the Set-Cookie HTTP response header helps mitigate the risk associated with Cross-Site Scripting (XSS) where an attacker's script code might attempt to read the contents of a cookie and exfiltrate information obtained. When set, browsers that support the flag will not reveal the contents of the cookie to a third party via client-side script executed via XSS.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		732	Incorrect Permission Assignment for Critical Resource	1367

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		442	Web Problems	1748

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

**Paradigm** : Web Based (*Prevalence = Undetermined*)

**Technology** : Web Server (*Prevalence = Undetermined*)

## Background Details

An HTTP cookie is a small piece of data attributed to a specific website and stored on the user's computer by the user's web browser. This data can be leveraged for a variety of purposes including saving information entered into form fields, recording user activity, and for authentication purposes. Cookies used to save or record information generated by the user are accessed and modified by script code embedded in a web page. While cookies used for authentication are created by the website's server and sent to the user to be attached to future requests. These authentication cookies are often not meant to be accessed by the web page sent to the user, and are instead just supposed to be attached to future requests to verify authentication details.

## Likelihood Of Exploit

Medium

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Read Application Data <i>If the HttpOnly flag is not set, then sensitive information stored in the cookie may be exposed to unintended parties.</i>	
Integrity	Gain Privileges or Assume Identity <i>If the cookie in question is an authentication cookie, then not setting the HttpOnly flag may allow an adversary to steal authentication data (e.g., a session ID) and assume the identity of the user.</i>	

## Potential Mitigations

### Phase: Implementation

Leverage the HttpOnly flag when setting a sensitive cookie in a response.

*Effectiveness = High*

While this mitigation is effective for protecting cookies from a browser's own scripting engine, third-party components or plugins may have their own engines that allow access to cookies. Attackers might also be able to use XMLHttpRequest to read the headers directly and obtain the cookie.

## Demonstrative Examples

### Example 1:

In this example, a cookie is used to store a session ID for a client's interaction with a website. The intention is that the cookie will be sent to the website with each request made by the client.

The snippet of code below establishes a new cookie to hold the sessionID.

Example Language: Java

(bad)

```
String sessionID = generateSessionId();
Cookie c = new Cookie("session_id", sessionID);
response.addCookie(c);
```

The HttpOnly flag is not set for the cookie. An attacker who can perform XSS could insert malicious script such as:

Example Language: JavaScript

(attack)

```
document.write('')
```

When the client loads and executes this script, it makes a request to the attacker-controlled web site. The attacker can then log the request and steal the cookie.

To mitigate the risk, use the setHttpOnly(true) method.

Example Language: Java

(good)

```
String sessionID = generateSessionId();
Cookie c = new Cookie("session_id", sessionID);
c.setHttpOnly(true);
response.addCookie(c);
```

## Observed Examples

Reference	Description
<b>CVE-2014-3852</b>	CMS written in Python does not include the HTTPOnly flag in a Set-Cookie header, allowing remote attackers to obtain potentially sensitive information via script access to this cookie. <a href="http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-3852">http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-3852</a>
<b>CVE-2015-4138</b>	Appliance for managing encrypted communications does not use HttpOnly flag. <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2015-4138">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2015-4138</a>

## CWE-1007: Insufficient Visual Distinction of Homoglyphs Presented to User

**Weakness ID** : 1007**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

### Description

The software displays information or identifiers to a user, but the display mechanism does not make it easy for the user to distinguish between visually similar or identical glyphs (homoglyphs), which may cause the user to misinterpret a glyph and perform an unintended, insecure action.

### Extended Description

Some glyphs, pictures, or icons can be semantically distinct to a program, while appearing very similar or identical to a human user. These are referred to as homoglyphs. For example, the lowercase "l" (ell) and uppercase "I" (eye) have different character codes, but these characters can be displayed in exactly the same way to a user, depending on the font. This can also occur between different character sets. For example, the Latin capital letter "A" and the Greek capital letter "Α" (Alpha) are treated as distinct by programs, but may be displayed in exactly the same way to a user. Accent marks may also cause letters to appear very similar, such as the Latin capital letter grave mark "À" and its equivalent "Â" with the acute accent.

Adversaries can exploit this visual similarity for attacks such as phishing, e.g. by providing a link to an attacker-controlled hostname that looks like a hostname that the victim trusts. In a different use of homoglyphs, an adversary may create a back door username that is visually similar to the username of a regular user, which then makes it more difficult for a system administrator to detect the malicious username while reviewing logs.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Nature	Type	ID	Name	Page
ChildOf		451	User Interface (UI) Misrepresentation of Critical Information	961

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		442	Web Problems	1748
ChildOf		451	User Interface (UI) Misrepresentation of Critical Information	961

### Weakness Ordinalities

**Resultant** :

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)**Paradigm** : Web Based (*Prevalence = Sometimes*)**Technology** : Web Server (*Prevalence = Sometimes*)

### Alternate Terms

**Homograph Attack** : "Homograph" is often used as a synonym of "homoglyph" by researchers, but according to Wikipedia, a homograph is a word that has multiple, distinct meanings.

### Likelihood Of Exploit

Medium

**Common Consequences**

Scope	Impact	Likelihood
Integrity Confidentiality	Other  <i>An attacker may ultimately redirect a user to a malicious website, by deceiving the user into believing the URL they are accessing is a trusted domain. However, the attack can also be used to forge log entries by using homoglyphs in usernames. Homoglyph manipulations are often the first step towards executing advanced attacks such as stealing a user's credentials, Cross-Site Scripting (XSS), or log forgery. If an attacker redirects a user to a malicious site, the attacker can mimic a trusted domain to steal account credentials and perform actions on behalf of the user, without the user's knowledge. Similarly, an attacker could create a username for a website that contains homoglyph characters, making it difficult for an admin to review logs and determine which users performed which actions.</i>	

**Detection Methods****Manual Dynamic Analysis**

If utilizing user accounts, attempt to submit a username that contains homoglyphs. Similarly, check to see if links containing homoglyphs can be sent via email, web browsers, or other mechanisms.

*Effectiveness = Moderate*

**Potential Mitigations****Phase: Implementation**

Use a browser that displays Punycode for IDNs in the URL and status bars, or which color code various scripts in URLs. Due to the prominence of homoglyph attacks, several browsers now help safeguard against this attack via the use of Punycode. For example, Mozilla Firefox and Google Chrome will display IDNs as Punycode if top-level domains do not restrict which characters can be used in domain names or if labels mix scripts for different languages.

**Phase: Implementation**

Use an email client that has strict filters and prevents messages that mix character sets to end up in a user's inbox. Certain email clients such as Google's GMail prevent the use of non-Latin characters in email addresses or in links contained within emails. This helps prevent homoglyph attacks by flagging these emails and redirecting them to a user's spam folder.

**Demonstrative Examples****Example 1:**

The following looks like a simple, trusted URL that a user may frequently access.

*Example Language:*

*(attack)*

```
http://www.#x#m###.##m
```

However, the URL above is comprised of Cyrillic characters that look identical to the expected ASCII characters. This results in most users not being able to distinguish between the two and assuming that the above URL is trusted and safe. The "e" is actually the "CYRILLIC SMALL LETTER IE" which is represented in HTML as the character `&#x0435`, while the "a" is actually the "CYRILLIC SMALL LETTER A" which is represented in HTML as the character `&#x0430`. The "p",

"c", and "o" are also Cyrillic characters in this example. Viewing the source reveals a URL of "http://www.&#x0435;x&#x0430;m&#x0440;l&#x0435;.&#x0441;&#x043e;m". An adversary can utilize this approach to perform an attack such as a phishing attack in order to drive traffic to a malicious website.

### Example 2:

The following displays an example of how creating usernames containing homoglyphs can lead to log forgery.

Assume an adversary visits a legitimate, trusted domain and creates the account "admin" where the 'a' and 'i' characters are Cyrillic characters instead of the expected ASCII. Any actions the adversary performs will be saved to the log file and look like they came from a legitimate administrator account.

Example Language:

(result)

```
123.123.123.123 #dm#n [17/Jul/2017:09:05:49 -0400] "GET /example/users/userlist HTTP/1.1" 401 12846
123.123.123.123 #dm#n [17/Jul/2017:09:06:51 -0400] "GET /example/users/userlist HTTP/1.1" 200 4523
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
123.123.123.123 #dm#n [17/Jul/2017:09:10:02 -0400] "GET /example/users/editusers HTTP/1.1" 200 6291
```

However, upon closer inspection, the account that generated these log entries is "&#x0430;dm&#x0456;n". This makes it more difficult to determine which actions were performed by the adversary and which actions were executed by the legitimate "admin" account.

### Observed Examples

Reference	Description
<b>CVE-2013-7236</b>	web forum allows impersonation of users with homoglyphs in account names <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-7236">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2013-7236</a>

## CWE-1021: Improper Restriction of Rendered UI Layers or Frames

<b>Weakness ID</b> : 1021	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The web application does not restrict or incorrectly restricts frame objects or UI layers that belong to another application or domain, which can lead to user confusion about which interface the user is interacting with.

## Extended Description

A web application is expected to place restrictions on whether it is allowed to be rendered within frames, iframes, objects, embed or applet elements. Without the restrictions, users can be tricked into interacting with the application when they were not intending to.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

MemberOf		442	Web Problems	1748
ChildOf		451	User Interface (UI) Misrepresentation of Critical Information	961

## Alternate Terms

**Clickjacking** :

**UI Redress Attack** :

**Tapjacking** : "Tapjacking" is similar to clickjacking, except it is used for mobile applications in which the user "taps" the application instead of performing a mouse click.

## Common Consequences

Scope	Impact	Likelihood
Access Control	Gain Privileges or Assume Identity Bypass Protection Mechanism Read Application Data Modify Application Data  <i>An attacker can trick a user into performing actions that are masked and hidden from the user's view. The impact varies widely, depending on the functionality of the underlying application. For example, in a social media application, clickjacking could be used to trick the user into changing privacy settings.</i>	

## Potential Mitigations

**Phase: Implementation**

The use of X-Frame-Options allows developers of web content to restrict the usage of their application within the form of overlays, frames, or iFrames. The developer can indicate from which domains can frame the content. The concept of X-Frame-Options is well documented, but

implementation of this protection mechanism is in development to cover gaps. There is a need for whitelisting and allowing frames from multiple domains.

#### Phase: Implementation

A developer can use a "frame-breaker" script in each page that should not be framed. This is very helpful for legacy browsers that do not support X-Frame-Options security feature previously mentioned. It is also important to note that this tactic has been circumvented or bypassed. Improper usage of frames can persist in the web application through nested frames. The "frame-breaking" script does not intuitively account for multiple nested frames that can be presented to the user.

#### Phase: Implementation

This defense-in-depth technique can be used to prevent the improper usage of frames in web applications. It prioritizes the valid sources of data to be loaded into the application through the usage of declarative policies. Based on which implementation of Content Security Policy is in use, the developer should use the "frame-ancestors" directive or the "frame-src" directive to mitigate this weakness. Both directives allow for the placement of restrictions when it comes to allowing embedded content.

#### Observed Examples

Reference	Description
<b>CVE-2017-7440</b>	E-mail preview feature in a desktop application allows clickjacking attacks via a crafted e-mail message <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-7440">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-7440</a>
<b>CVE-2017-5697</b>	Hardware/firmware product has insufficient clickjacking protection in its web user interface <a href="https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5697">https://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2017-5697</a>

## CWE-1022: Use of Web Link to Untrusted Target with window.opener Access

Weakness ID : 1022

Status: Incomplete

**Structure** : Simple  
**Abstraction** : Variant

## Description

The web application produces links to untrusted external sites outside of its sphere of control, but it does not properly prevent the external site from modifying security-critical properties of the window.opener object, such as the location property.

## Extended Description

When a user clicks a link to an external site ("target"), the target="\_blank" attribute causes the target site's contents to be opened in a new window or tab, which runs in the same process as the original page. The window.opener object records information about the original page that offered the link. If an attacker can run script on the target page, then they could read or modify certain properties of the window.opener object, including the location property - even if the original and target site are not the same origin. An attacker can modify the location property to automatically redirect the user to a malicious site, e.g. as part of a phishing attack. Since this redirect happens in the original window/tab - which is not necessarily visible, since the browser is focusing the display on the new target page - the user might not notice any suspicious redirection.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		266	Incorrect Privilege Assignment	583

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		442	Web Problems	1748
ChildOf		266	Incorrect Privilege Assignment	583

## Applicable Platforms

**Language** : JavaScript (*Prevalence = Often*)

**Paradigm** : Web Based (*Prevalence = Often*)

## Alternate Terms

**tabnabbing** :

## Likelihood Of Exploit

Medium

## Common Consequences

Scope	Impact	Likelihood
Confidentiality	Alter Execution Logic  <i>The user may be redirected to an untrusted page that contains undesired content or malicious script code.</i>	

## Potential Mitigations

### Phase: Architecture and Design

Specify in the design that any linked external document must not be granted access to the location object of the calling page.

### Phase: Implementation

When creating a link to an external document using the <a> tag with a defined target, for example "\_blank" or a named frame, provide the rel attribute with a value "noopener noreferrer". If opening the external document in a new window via javascript, then reset the opener by setting it equal to null.

### Phase: Implementation

Do not use "\_blank" targets. However, this can affect the usability of your application.

### Demonstrative Examples

#### Example 1:

In this example, the application opens a link in a named window/tab without taking precautions to prevent the called page from tampering with the calling page's location in the browser.

There are two ways that this weakness is commonly seen. The first is when the application generates an <a> tag is with target="\_blank" to point to a target site:

Example Language: HTML

(bad)

```
<a href="http://attacker-site.example.com/useful-page.html" target="_blank">
```

If the attacker offers a useful page on this link (or compromises a trusted, popular site), then a user may click on this link. However, the attacker could use scripting code to modify the window.opener's location property to redirect the application to a malicious, attacker-controlled page - such as one that mimics the look and feel of the original application and convinces the user to re-enter authentication credentials, i.e. phishing:

Example Language: JavaScript

(attack)

```
window.opener.location = 'http://phishing.example.org/popular-bank-page';
```

To mitigate this type of weakness, some browsers support the "rel" attribute with a value of "noopener", which sets the window.opener object equal to null. Another option is to use the "rel" attribute with a value of "noreferrer", which in essence does the same thing.

Example Language: HTML

(good)

```
<a href="http://attacker-site.example.com/useful-page.html" target="_blank" rel="noopener noreferrer">
```

A second way that this weakness is commonly seen is when opening a new site directly within JavaScript. In this case, a new site is opened using the window.open() function.

Example Language: JavaScript

(bad)

```
var newWindow = window.open("http://attacker-site.example.com/useful-page.html", "_blank");
```

To mitigate this, set the window.opener object to null.

Example Language: JavaScript

(good)

```
var newWindow = window.open("http://attacker-site.example.com/useful-page.html", "_blank");
newWindow.opener = null;
```

## CWE-1023: Incomplete Comparison with Missing Factors

<b>Weakness ID</b> : 1023	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software performs a comparison between entities that must consider multiple factors or characteristics of each entity, but the comparison does not include one or more of these factors. This can lead to resultant weaknesses, e.g. by operating on the wrong object.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1350
ParentOf		184	Incomplete Blacklist	433
ParentOf		187	Partial String Comparison	440
ParentOf		478	Missing Default Case in Switch Statement	1016
ParentOf		839	Numeric Range Comparison Without Minimum Check	1551

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1350

### Weakness Ordinalities

**Primary** :

### Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Integrity	Alter Execution Logic	
Access Control	Bypass Protection Mechanism	

### Potential Mitigations

**Phase: Testing**

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

### Demonstrative Examples

**Example 1:**

This example defines a fixed username and password. The AuthenticateUser() function is intended to accept a username and a password from an untrusted user, and check to ensure that it matches the username and password. If the username and password match, AuthenticateUser() is intended to indicate that authentication succeeded.

Example Language: C

(bad)

```

/* Ignore CWE-259 (hard-coded password) and CWE-309 (use of password system for authentication) for this example. */
char *username = "admin";
char *pass = "password";
int AuthenticateUser(char *inUser, char *inPass) {
    if (strncmp(username, inUser, strlen(inUser))) {
        logEvent("Auth failure of username using strlen of inUser");
        return(AUTH_FAIL);
    }
    if (!strncmp(pass, inPass, strlen(inPass))) {
        logEvent("Auth success of password using strlen of inUser");
        return(AUTH_SUCCESS);
    }
    else {
        logEvent("Auth fail of password using sizeof");
        return(AUTH_FAIL);
    }
}
int main (int argc, char **argv) {
    int authResult;
    if (argc < 3) {
        ExitError("Usage: Provide a username and password");
    }
    authResult = AuthenticateUser(argv[1], argv[2]);
    if (authResult == AUTH_SUCCESS) {
        DoAuthenticatedTask(argv[1]);
    }
    else {
        ExitError("Authentication failed");
    }
}

```

In `AuthenticateUser()`, the `strncmp()` call uses the string length of an attacker-provided `inPass` parameter in order to determine how many characters to check in the password. So, if the attacker only provides a password of length 1, the check will only examine the first byte of the application's password before determining success.

As a result, this partial comparison leads to improper authentication (CWE-287).

Any of these passwords would still cause authentication to succeed for the "admin" user:

Example Language:

(attack)

```

p
pa
pas
pass

```

This significantly reduces the search space for an attacker, making brute force attacks more feasible.

The same problem also applies to the username, so values such as "a" and "adm" will succeed for the username.

While this demonstrative example may not seem realistic, see the Observed Examples for CVE entries that effectively reflect this same weakness.

## CWE-1024: Comparison of Incompatible Types

Weakness ID : 1024

Status: Incomplete

Structure : Simple

Abstraction : Base

## Description

The software performs a comparison between two entities, but the entities are of different, incompatible types that cannot be guaranteed to provide correct results when they are directly compared.

## Extended Description

In languages that are strictly typed but support casting/conversion, such as C or C++, the programmer might assume that casting one entity to the same type as another entity will ensure that the comparison will be performed correctly, but this cannot be guaranteed. In languages that are not strictly typed, such as PHP or JavaScript, there may be implicit casting/conversion to a type that the programmer is unaware of, causing unexpected results; for example, the string "123" might be converted to a number type. See examples.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1350

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1350

## Weakness Ordinalities

**Primary :**

## Applicable Platforms

**Language :** JavaScript (*Prevalence = Undetermined*)

**Language :** PHP (*Prevalence = Undetermined*)

**Language :** Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	

## Potential Mitigations

### Phase: Testing

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

## CWE-1025: Comparison Using Wrong Factors

<b>Weakness ID :</b> 1025	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

## Description

The software performs a comparison between two entities, but the comparison examines the wrong factors or characteristics of the entities, which can lead to incorrect results and resultant weaknesses.

### Extended Description

A common example of this weakness occurs when the code inadvertently extracts the reference to an object, instead of its relevant contents.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1350
ParentOf		486	Comparison of Classes by Name	1034
ParentOf		595	Comparison of Object References Instead of Object Contents	1186

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1350

### Weakness Ordinalities

**Primary :**

### Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

### Common Consequences

Scope	Impact	Likelihood
Other	Varies by Context	

### Potential Mitigations

#### Phase: Testing

Thoroughly test the comparison scheme before deploying code into production. Perform positive testing as well as negative testing.

### Demonstrative Examples

#### Example 1:

In the example below, two Java String objects are declared and initialized with the same string values and an if statement is used to determine if the strings are equivalent.

*Example Language: Java*

*(bad)*

```
String str1 = new String("Hello");
String str2 = new String("Hello");
if (str1 == str2) {
    System.out.println("str1 == str2");
}
```

However, the if statement will not be executed as the strings are compared using the "==" operator. For Java objects, such as String objects, the "==" operator compares object references, not object values. While the two String objects above contain the same string values, they refer to different

object references, so the `System.out.println` statement will not be executed. To compare object values, the previous code could be modified to use the `equals` method:

Example Language:

(good)

```
if (str1.equals(str2)) {
    System.out.println("str1 equals str2");
}
```

## CWE-1037: Processor Optimization Removal or Modification of Security-critical Code

**Weakness ID :** 1037

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The developer builds a security-critical protection mechanism into the software, but the processor optimizes the execution of the program such that the mechanism is removed or modified.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as `ChildOf`, `ParentOf`, `MemberOr` and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as `PeerOf` and `CanAlsoBe` are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		1038	Insecure Automated Optimizations	1638

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		1038	Insecure Automated Optimizations	1638

### Weakness Ordinalities

**Primary :** This weakness does not depend on other weaknesses and is the result of choices made by the processor in executing the specified application.

### Applicable Platforms

**Language :** Language-Independent (*Prevalence = Rarely*)

### Likelihood Of Exploit

Low

### Common Consequences

Scope	Impact	Likelihood
Integrity	Bypass Protection Mechanism	High
<p><i>A successful exploitation of this weakness will change the order of an application's execution and will likely be used to bypass specific protection mechanisms. This bypass can be exploited further to potentially read data that should otherwise be inaccessible.</i></p>		

### Detection Methods

**White Box**

In theory this weakness can be detected through the use of white box testing techniques where specifically crafted test cases are used in conjunction with debuggers to verify the order of statements being executed.

*Effectiveness = Opportunistic*

*Although the mentioned detection method is theoretically possible, the use of speculative execution is a preferred way of increasing processor performance. The reality is that a large number of statements are executed out of order, and determining if any of them break an access control property would be extremely opportunistic.*

### Observed Examples

Reference	Description
<b>CVE-2017-5715</b>	Intel, ARM, and AMD processor optimizations related to speculative execution and branch prediction cause access control checks to be bypassed when placing data into the cache. ## CWE-1038: Insecure Automated Optimizations

**Weakness ID** : 1038

**Status**: Draft

**Structure** : Simple

**Abstraction** : Class

### Description

The product uses a mechanism that automatically optimizes code, e.g. to improve a characteristic such as performance, but the optimizations can have an unintended side effect that might violate an intended security assumption.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

### Weakness Ordinalities

**Primary :** This weakness does not depend on other weaknesses and is the result of choices made during optimization.

### Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

### Likelihood Of Exploit

Low

### Common Consequences

Scope	Impact	Likelihood
Integrity	Alter Execution Logic  <i>The optimizations alter the order of execution resulting in side effects that were not intended by the original developer.</i>	

## CWE-1039: Automated Recognition Mechanism with Inadequate Detection or Handling of Adversarial Input Perturbations

<b>Weakness ID :</b> 1039	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Class	

### Description

The product uses an automated mechanism such as machine learning to recognize complex data inputs (e.g. image or audio) as a particular concept or category, but it does not properly detect or handle inputs that have been modified or constructed in a way that causes the mechanism to detect a different, incorrect concept.

### Extended Description

When techniques such as machine learning are used to automatically classify input streams, and those classifications are used for security-critical decisions, then any mistake in classification can introduce a vulnerability that allows attackers to cause the product to make the wrong security decision. If the automated mechanism is not developed or "trained" with enough input data, then attackers may be able to craft malicious input that intentionally triggers the incorrect classification.

Targeted technologies include, but are not necessarily limited to:

- automated speech recognition
- automated image recognition

For example, an attacker might modify road signs or road surface markings to trick autonomous vehicles into misreading the sign/markings and performing a dangerous action.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		697	Incorrect Comparison	1350
ChildOf		693	Protection Mechanism Failure	1344

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		19	Data Processing Errors	1728

## Weakness Ordinalities

**Primary** : This weakness does not depend on other weaknesses and is the result of choices made during optimization.

## Applicable Platforms

**Language** : Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Integrity	Bypass Protection Mechanism  <i>When the automated recognition is used in a protection mechanism, an attacker may be able to craft inputs that are misinterpreted in a way that grants excess privileges.</i>	

## Notes

### Relationship

Further investigation is needed to determine if better relationships exist or if additional organizational entries need to be created. For example, this issue might be better related to "recognition of input as an incorrect type," which might place it as a sibling of CWE-704 (incorrect type conversion).

## CWE-1041: Use of Redundant Code

<b>Weakness ID</b> : 1041	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software has multiple functions, methods, procedures, macros, etc. that contain the same code.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. For example, if there are two copies of the same code, the programmer might fix a weakness in one copy while forgetting to fix the same weakness in another copy.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1042: Static Member Data Element outside of a Singleton Class Element

**Weakness ID :** 1042

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Variant

### Description

The code contains a member element that is declared as static (but not final), in which its parent class element is not a singleton class - that is, a class element that can be used only once in the 'to' association of a Create action.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements

<b>Weakness ID</b> : 1043	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software uses a data element that has an excessively large number of sub-elements with non-primitive data types such as structures or aggregated objects.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "excessively large" may vary for each product or developer, CISQ recommends a default of 5 sub-elements.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range

**Weakness ID :** 1044

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

## Description

The software's architecture contains too many - or too few - horizontal layers.

## Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "expected range" may vary for each product or developer, CISQ recommends a default minimum of 4 layers and maximum of 8 layers.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor

<b>Weakness ID</b> : 1045	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

## Description

A parent class has a virtual destructor method, but the parent has a child class that does not have a virtual destructor.

## Extended Description

This issue can prevent the software from running reliably, since the child might not perform essential destruction operations. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability, such as a memory leak (CWE-401).

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1046: Creation of Immutable Text Using String Concatenation

**Weakness ID :** 1046

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The software creates an immutable text string using string concatenation operations.

### Extended Description

This programming pattern can be inefficient in comparison with use of text buffer data elements.

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1047: Modules with Circular Dependencies

<b>Weakness ID</b> : 1047	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains modules in which one module has references that cycle back to itself, i.e., there are circular dependencies.

### Extended Description

As an example, with Java, this weakness might indicate cycles between packages.

This issue makes it more difficult to maintain the software due to insufficient modularity, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1048: Invokable Control Element with Large Number of Outward Calls

**Weakness ID :** 1048 **Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The code contains callable control elements that contain an excessively large number of references to other application objects external to the context of the callable, i.e. a Fan-Out value that is excessively large.

### Extended Description

While the interpretation of "excessively large Fan-Out value" may vary for each product or developer, CISQ recommends a default of 5 referenced objects.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1049: Excessive Data Query Operations in a Large Data Table

<b>Weakness ID :</b> 1049	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

### Description

The software performs a data query with a large number of joins and sub-queries on a large data table.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "large number of joins or sub-queries" may vary for each product or developer, CISQ recommends a default of 1 million rows for a "large" data table, a default minimum of 5 joins, and a default minimum of 3 sub-queries.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1050: Excessive Platform Resource Consumption within a Loop

<b>Weakness ID</b> : 1050	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The software has a loop body or loop condition that contains a control element that directly or indirectly consumes platform resources, e.g. messaging, sessions, locks, or file descriptors.

## Extended Description

This issue can make the software perform more slowly. If an attacker can influence the number of iterations in the loop, then this performance problem might allow a denial of service by consuming more platform resources than intended.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**CWE-1051: Initialization with Hard-Coded Network Resource Configuration Data**

<b>Weakness ID :</b> 1051	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

**Description**

The software initializes data using hard-coded values that act as as network resource identifiers.

**Extended Description**

This issue can prevent the software from running reliably, e.g. if it runs in an environment does not use the hard-coded network resource identifiers. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer

**Weakness ID :** 1054

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The code at one architectural layer invokes code that resides at a deeper layer than the adjacent layer, i.e., the invocation skips at least one layer, and the invoked code is not part of a vertical utility layer that can be referenced from any horizontal layer.

### Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. **CWE-1056: Invokable Control Element with Variadic Parameters****Weakness ID** : 1056**Status**: Incomplete**Structure** : Simple**Abstraction** : Base**Description**

A named-callable or method control element has a signature that supports a variable (variadic) number of parameters or arguments.

**Extended Description**

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

With variadic arguments, it can be difficult or inefficient for manual analysis to be certain of which function/method is being invoked.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1057: Data Access Operations Outside of Expected Data Manager Component

<b>Weakness ID</b> : 1057	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software uses a dedicated, central data manager component as required by design, but it contains code that performs data-access operations that do not use this data manager.

### Extended Description

This issue can make the software perform more slowly than intended, since the intended central data manager may have been explicitly optimized for performance or other quality characteristics. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1058: Invokable Control Element in Multi-Thread Context with non-Final Static Storable or Member Element

Weakness ID : 1058

Status: Incomplete

Structure : Simple

Abstraction : Base

### Description

The code contains a function or method that operates in a multi-threaded environment but owns an unsafe non-final static storable or member data element.

### Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		662	Improper Synchronization	1288

*Relevant to the view "Development Concepts" (CWE-699)*

## CWE-1059: Incomplete Documentation

<b>Weakness ID</b> : 1059	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The documentation, whether on paper or in electronic form, does not contain descriptions of all the relevant elements of the product, such as its usage, structure, interfaces, design, implementation, configuration, operation, etc.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		710	Improper Adherence to Coding Standards	1366

Other	Reduce Maintainability	

## CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses

<b>Weakness ID</b> : 1060	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software performs too many data queries without using efficient data processing functionality such as stored procedures.

### Extended Description

This issue can make the software perform more slowly due to computational expense. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "too many data queries" may vary for each product or developer, CISQ recommends a default maximum of 5 data queries for an inefficient function/procedure.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1061: Insufficient Encapsulation

Weakness ID : 1061

Status: Incomplete

Structure : Simple

Abstraction : Class

## Description

The software does not sufficiently hide the internal representation and implementation details of data or methods, which might allow external components or modules to modify data unexpectedly, invoke unexpected functionality, or introduce dependencies that the programmer did not intend.

## Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1062: Parent Class with References to Child Class

**Weakness ID :** 1062

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The code has a parent class that contains references to a child class, its methods, or its members.

### Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**CWE-1063: Creation of Class Instance within a Static Code Block**

<b>Weakness ID</b> : 1063	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

**Description**

A static code block creates an instance of a class.

**Extended Description**

This pattern identifies situations where a storable data element or member data element is initialized with a value in a block of code which is declared as static.

This issue can make the software perform more slowly by performing initialization before it is needed. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters

Weakness ID : 1064

Status: Incomplete

Structure : Simple

Abstraction : Base

### Description

The software contains a function, subroutine, or method whose signature has an unnecessarily large number of parameters/arguments.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of parameters." may vary for each product or developer, CISQ recommends a default maximum of 7 parameters/arguments.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers

<b>Weakness ID</b> : 1065	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The application uses deployed components from application servers, but it also uses low-level functions/methods for management of resources, instead of the API provided by the application server.

### Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1066: Missing Serialization Control Element

**Weakness ID** : 1066**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

### Description

The software contains a serializable data element that does not have an associated serialization method.

### Extended Description

This issue can prevent the software from running reliably, e.g. by triggering an exception. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

As examples, the serializable nature of a data element comes from a serializable `SerializableAttribute` attribute in .NET and the inheritance from the `java.io.Serializable` interface in Java.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as `ChildOf`, `ParentOf`, `MemberOf` and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as `PeerOf` and `CanAlsoBe` are defined to show similar weaknesses that may want to be explored.

## CWE-1067: Excessive Execution of Sequential Searches of Data Resource

**Weakness ID** : 1067**Status**: Incomplete**Structure** : Simple**Abstraction** : Base

### Description

The software contains a data query against an SQL table or view that is configured in a way that does not utilize an index and may cause sequential searches to be performed.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1068: Inconsistency Between Implementation and Documented Design

**Weakness ID** : 1068**Status**: Incomplete

**Structure** : Simple  
**Abstraction** : Base

## Description

The implementation of the product is not consistent with the design as described within the relevant documentation.

## Extended Description

This issue makes it more difficult to maintain the software due to inconsistencies, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1069: Empty Exception Block

**Weakness ID** : 1069 **Status**: Incomplete  
**Structure** : Simple  
**Abstraction** : Variant

## Description

An invocable code block contains an exception handling block that does not contain any code, i.e. is empty.

## Extended Description

When an exception handling block (such as a Catch and Finally block) is used, but that block is empty, this can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to

similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1070: Serializable Data Element Containing non-Serializable Item Elements

<b>Weakness ID</b> : 1070	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The software contains a serializable, storable data element such as a field or member, but the data element contains member elements that are not serializable.

### Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

As examples, the serializable nature of a data element comes from a serializable SerializableAttribute attribute in .NET and the inheritance from the java.io.Serializable interface in Java.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1071: Empty Code Block

<b>Weakness ID</b> : 1071	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

### Description

The source code contains a block that does not contain any code, i.e., the block is empty.

### Extended Description

Empty code blocks can occur in the bodies of conditionals, function or method definitions, exception handlers, etc. While an empty code block might be intentional, it might also indicate incomplete implementation, accidental code deletion, unexpected macro expansion, etc. For some programming languages and constructs, an empty block might be allowed by the syntax, but the lack of any behavior within the block might violate a convention or API in such a way that it is an error.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Scope	Impact	Likelihood
Other	Reduce Reliability	

## CWE-1072: Data Resource Access without Use of Connection Pooling

<b>Weakness ID :</b> 1072	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

### Description

The software accesses a data resource through a database without using a connection pooling capability.

### Extended Description

This issue can make the software perform more slowly, as connection pools allow connections to be reused without the overhead and time consumption of opening and closing a new connection. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1073: Non-SQL Invokable Control Element with Excessive Number of Data Resource Accesses

Weakness ID : 1073 Status: Incomplete

Structure : Simple

Abstraction : Base

## Description

The software contains a client with a function or method that contains a large number of data accesses/queries that are sent through a data manager, i.e., does not use efficient database capabilities.

## Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large number of data accesses/queries" may vary for each product or developer, CISQ recommends a default maximum of 2 data accesses per function/method.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf	G	405	Asymmetric Resource Consumption (Amplification)	881

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
ChildOf		405	Asymmetric Resource Consumption (Amplification)	881

## CWE-1074: Class with Excessively Deep Inheritance

<b>Weakness ID</b> : 1074	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

A class has an inheritance level that is too high, i.e., it has a large number of parent classes.

### Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of parent classes" may vary for each product or developer, CISQ recommends a default maximum of 7 parent classes.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1075: Unconditional Control Flow Transfer outside of Switch Block

**Weakness ID :** 1075 **Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The software performs unconditional control transfer (such as a "goto") in code outside of a branching structure such as a switch block.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1076: Insufficient Adherence to Expected Conventions

<b>Weakness ID</b> : 1076	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

### Description

The product's architecture, source code, design, documentation, or other artifact does not follow required conventions.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page

Other	Reduce Maintainability	

## CWE-1077: Floating Point Comparison with Incorrect Operator

**Weakness ID :** 1077

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Variant

### Description

The code performs a comparison such as an equality test between two float (floating point) values, but it uses comparison operators that do not account for the possibility of loss of precision.

### Extended Description

Numeric calculation using floating point values can generate imprecise results because of rounding errors. As a result, two different calculations might generate numbers that are mathematically equal, but have slightly different bit representations that do not translate to the same mathematically-equal values. As a result, an equality test or other comparison might produce unexpected results.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1079: Parent Class without Virtual Destructor Method

**Weakness ID :** 1079

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

A parent class contains one or more child classes, but the parent class does not have a virtual destructor method.

## Extended Description

This issue can prevent the software from running reliably due to undefined or unexpected behaviors. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1080: Source Code File with Excessive Number of Lines of Code

<b>Weakness ID</b> : 1080	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

A source code file has too many lines of code.

## Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "too many lines of code" may vary for each product or developer, CISQ recommends a default threshold value of 1000.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1082: Class Instance Self Destruction Control Element

Weakness ID : 1082

Status: Incomplete

Structure : Simple

Abstraction : Base

## Description

The code contains a class instance that calls the method or function to delete or destroy itself.

## Extended Description

For example, in C++, "delete this" will cause the object to delete itself.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1083: Data Access from Outside Expected Data Manager Component

<b>Weakness ID</b> : 1083	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The software is intended to manage data access through a particular data manager component such as a relational or non-SQL database, but it contains code that performs data access operations without using that component.

### Extended Description

When the software has a data access component, the design may be intended to handle all data access operations through that component. If a data access operation is performed outside of that component, then this may indicate a violation of the intended design.

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1084: Invokable Control Element with Excessive File or Data Access Operations

Weakness ID : 1084

Status: Incomplete

**Structure** : Simple  
**Abstraction** : Base

## Description

A function or method contains too many operations that utilize a data manager or file resource.

## Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "too many operations" may vary for each product or developer, CISQ recommends a default maximum of 7 operations for the same data manager or file.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code

Weakness ID : 1085

Status: Incomplete

Structure : Simple

Abstraction : Base

### Description

A function, method, procedure, etc. contains an excessive amount of code that has been commented out within its body.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "excessive volume" may vary for each product or developer, CISQ recommends a default threshold of 2% of commented code.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1086: Class with Excessive Number of Child Classes

**Weakness ID :** 1086  
**Structure :** Simple  
**Abstraction :** Base

**Status:** Incomplete

### Description

A class contains an unnecessarily large number of children.

### Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

While the interpretation of "large number of children" may vary for each product or developer, CISQ recommends a default maximum of 10 child classes.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**CWE-1088: Synchronous Access of Remote Resource without Timeout****Weakness ID** : 1088**Status**: Incomplete

**Structure** : Simple  
**Abstraction** : Base

### Description

The code has a synchronous call to a remote resource, but there is no timeout for the call, or the timeout is set to infinite.

### Extended Description

This issue can prevent the software from running reliably, since an outage for the remote resource can cause the software to hang. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1089: Large Data Table with Excessive Number of Indices

**Weakness ID** : 1089 **Status**: Incomplete  
**Structure** : Simple  
**Abstraction** : Base

## Description

The software uses a large data table that contains an excessively large number of indices.

## Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "excessively large number of indices" may vary for each product or developer, CISQ recommends a default threshold of 1000000 rows for a "large" table and a default threshold of 3 indices.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1090: Method Containing Access of a Member Element from Another Class

Weakness ID : 1090

Status: Incomplete

Structure : Simple

**Abstraction** : Base**Description**

A method for a class performs an operation that directly accesses a member element from another class.

**Extended Description**

This issue suggests poor encapsulation and makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**CWE-1091: Use of Object without Invoking Destructor Method**

**Weakness ID** : 1091

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

## Description

The software contains a method that accesses an object but does not later invoke the element's associated finalize/destructor method.

## Extended Description

This issue can make the software perform more slowly by retaining memory and/or other resources longer than necessary. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers

<b>Weakness ID</b> : 1092	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The software uses the same control element across multiple architectural layers.

## Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1093: Excessively Complex Data Representation

<b>Weakness ID</b> : 1093	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Class	

## Description

The software uses an unnecessarily complex internal representation for its data structures or interrelationships between those structures.

### Extended Description

This issue makes it more difficult to understand or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page

## CWE-1094: Excessive Index Range Scan for a Data Resource

Weakness ID : 1094

Status: Incomplete

Structure : Simple

Abstraction : Base

### Description

The software contains an index range scan for a large data table, but the scan can cover a large number of rows.

### Extended Description

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

While the interpretation of "large data table" and "excessive index range" may vary for each product or developer, CISQ recommends a threshold of 1000000 table rows and a threshold of 10 for the index range.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1095: Loop Condition Value Update within the Loop

<b>Weakness ID :</b> 1095	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

## Description

The software uses a loop with a control flow condition based on a value that is updated within the body of the loop.

## Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1096: Singleton Class Instance Creation without Proper Locking or Synchronization

<b>Weakness ID</b> : 1096	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Variant	

## Description

The software implements a Singleton design pattern but does not use appropriate locking or other synchronization mechanism to ensure that the singleton class is only instantiated once.

## Extended Description

This issue can prevent the software from running reliably, e.g. by making the instantiation process non-thread-safe and introducing deadlock (CWE-833) or livelock conditions. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element

<b>Weakness ID</b> : 1097	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The software uses a storable data element that does not have all of the associated functions or methods that are necessary to support comparison.

## Extended Description

For example, with Java, a class that is made persistent requires both hashCode() and equals() methods to be defined.

This issue can prevent the software from running reliably, due to incorrect or unexpected comparison results. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element

Weakness ID : 1098

Status: Incomplete

Structure : Simple

Abstraction : Variant

## Description

1696

The code contains a data element with a pointer that does not have an associated copy or constructor method.

### Extended Description

This issue can prevent the software from running reliably. If the relevant code is reachable by an attacker, then this reliability problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1099: Inconsistent Naming Conventions for Identifiers

<b>Weakness ID</b> : 1099	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product's code, documentation, or other artifacts do not consistently use the same naming conventions for variables, callables, groups of related callables, I/O capabilities, data types, file names, or similar types of elements.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software due to inconsistencies, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1100: Insufficient Isolation of System-Dependent Functions

**Weakness ID :** 1100

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The product or code does not isolate system-dependent functionality into separate standalone modules.

### Extended Description

This issue makes it more difficult to maintain and/or port the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1101: Reliance on Runtime Component in Generated Code

<b>Weakness ID :</b> 1101	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

### Description

The product uses automatically-generated code that cannot be executed without a specific runtime support component.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. ## CWE-1102: Reliance on Machine-Dependent Data Representation

<b>Weakness ID</b> : 1102	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The code uses a data representation that relies on low-level data representation or constructs that may vary across different processors, physical machines, OSes, or other physical components.

## Extended Description

This issue makes it more difficult to maintain and/or port the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. ## CWE-1103: Use of Platform-Dependent Third Party Components

<b>Weakness ID</b> : 1103	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product relies on third-party software components that do not provide equivalent functionality across all desirable platforms.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		758	Reliance on Undefined, Unspecified, or Implementation-Defined Behavior	1393

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		1006	Bad Coding Practices	1843

### Weakness Ordinalities

**Indirect** :

### Common Consequences

Scope	Impact	Likelihood
Other	Reduce Maintainability

## CWE-1104: Use of Unmaintained Third Party Components

<b>Weakness ID</b> : 1104	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The product relies on third-party components that are not actively supported or maintained by the original developer or a trusted proxy for the original developer.

### Extended Description

Reliance on components that are no longer maintained can make it difficult or impossible to fix significant bugs, vulnerabilities, or quality issues. In effect, unmaintained code can become obsolete.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		710	Improper Adherence to Coding Standards	1366

*Relevant to the view "Development Concepts" (CWE-699)*

Nature	Type	ID	Name	Page
MemberOf		1006	Bad Coding Practices	1843

### Weakness Ordinalities

### Common Consequences

Scope	Impact	Likelihood
Other	Reduce Maintainability	

## CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality

Weakness ID : 1105

Status: Incomplete

Structure : Simple

Abstraction : Base

### Description

The product or code uses machine-dependent functionality, but it does not sufficiently encapsulate or isolate this functionality from the rest of the code.

### Extended Description

This issue makes it more difficult to port or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**CWE-1106: Insufficient Use of Symbolic Constants**

<b>Weakness ID :</b> 1106	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

**Description**

The source code uses literal constants that may need to change or evolve over time, instead of using symbolic constants.

**Extended Description**

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Relevant to the view "Research Concepts" (CWE-1000)

Nature	Type	ID	Name	Page
ChildOf		1078	Inappropriate Source Code Style or Formatting	1677

## CWE-1107: Insufficient Isolation of Symbolic Constant Definitions

Weakness ID : 1107

Status: Incomplete

Structure : Simple

Abstraction : Base

## Description

The source code uses symbolic constants, but it does not sufficiently place the definitions of these constants into a more centralized or isolated location.

## Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1108: Excessive Reliance on Global Variables

<b>Weakness ID</b> : 1108	<b>Status:</b> Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code is structured in a way that relies too much on using or setting global variables throughout various points in the code, instead of preserving the associated information in a narrower, more local context.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		1076	Insufficient Adherence to Expected Conventions	1675

## CWE-1109: Use of Same Variable for Multiple Purposes

<b>Weakness ID</b> : 1109	<b>Status:</b> Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code contains a callable, block, or other code element in which the same variable is used to control more than one unique task or store more than one instance of data.

### Extended Description

Use of the same variable for multiple purposes can make it more difficult for a person to read or understand the code, potentially hiding other quality issues.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1110: Incomplete Design Documentation

**Weakness ID :** 1110

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The product's design documentation does not adequately describe control flow, data flow, system initialization, relationships between tasks, components, rationales, or other important aspects of the design.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1111: Incomplete I/O Documentation

<b>Weakness ID :</b> 1111	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

### Description

The product's documentation does not adequately define inputs, outputs, or system/software interfaces.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

## CWE-1112: Incomplete Documentation of Program Execution

<b>Weakness ID :</b> 1112	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	

**Abstraction** : Base**Description**

The document does not fully define all mechanisms that are used to control or influence how product-specific programs are executed.

**Extended Description**

This includes environmental variables, configuration files, registry keys, command-line switches or options, or system settings.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

**CWE-1113: Inappropriate Comment Style**

**Weakness ID** : 1113

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

**Description**

The source code uses comment styles or formats that are inconsistent or do not follow expected standards for the product.

**Extended Description**

This issue makes it more difficult to maintain the software due to insufficient legibility, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1114: Inappropriate Whitespace Style

<b>Weakness ID :</b> 1114	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

### Description

The source code contains whitespace that is inconsistent across the code or does not follow expected standards for the product.

### Extended Description

This issue makes it more difficult to understand and maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1115: Source Code Element without Standard Prologue

<b>Weakness ID</b> : 1115	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The source code contains elements such as source files that do not consistently provide a prologue or header that has been standardized for the project.

### Extended Description

The lack of a prologue can make it more difficult to accurately and quickly understand the associated code. Standard prologues or headers may contain information such as module name, version number, author, date, purpose, function, assumptions, limitations, accuracy considerations, etc.

This issue makes it more difficult to maintain the software due to insufficient analyzability, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1116: Inaccurate Comments

<b>Weakness ID</b> : 1116	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The source code contains comments that do not accurately describe or explain aspects of the portion of the code with which the comment is associated.

### Extended Description

When a comment does not accurately reflect the associated code elements, this can introduce confusion to a reviewer (due to inconsistencies) or make it more difficult and less efficient to validate that the code is implementing the intended behavior correctly.

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1117: Callable with Insufficient Behavioral Summary

<b>Weakness ID :</b> 1117	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

### Description

The code contains a function or method whose signature and/or associated inline documentation does not sufficiently describe the callable's inputs, outputs, side effects, assumptions, or return codes.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1118: Insufficient Documentation of Error Handling Techniques

<b>Weakness ID</b> : 1118	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

## Description

The documentation does not sufficiently describe the techniques that are used for error handling, exception processing, or similar mechanisms.

## Extended Description

Documentation may need to cover error handling techniques at multiple layers, such as module, executable, compilable code unit, or callable.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1119: Excessive Use of Unconditional Branching

<b>Weakness ID</b> : 1119	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code uses too many unconditional branches (such as "goto").

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1120: Excessive Code Complexity

**Weakness ID** : 1120**Status**: Incomplete**Structure** : Simple**Abstraction** : Class

### Description

The code is too complex, as calculated using a well-defined, quantitative measure.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

This issue can make the software perform more slowly. If the relevant code is reachable by an attacker, then this performance problem might introduce a vulnerability.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

Nature	Type	ID	Name	Page
ChildOf		710	Improper Adherence to Coding Standards	1366

## CWE-1121: Excessive McCabe Cyclomatic Complexity

<b>Weakness ID</b> : 1121	<b>Status</b> : Incomplete
<b>Structure</b> : Simple	
<b>Abstraction</b> : Base	

### Description

The code contains McCabe cyclomatic complexity that exceeds a desirable maximum.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1122: Excessive Halstead Complexity

**Weakness ID :** 1122

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Base

### Description

The code is structured in a way that a Halstead complexity measure exceeds a desirable maximum.

### Extended Description

A variety of Halstead complexity measures exist, such as program vocabulary size or volume.

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1123: Excessive Use of Self-Modifying Code

**Weakness ID** : 1123

**Status**: Incomplete

**Structure** : Simple

**Abstraction** : Base

### Description

The product uses too much self-modifying code.

### Extended Description

This issue makes it more difficult to understand or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1124: Excessively Deep Nesting

**Weakness ID** : 1124

**Status**: Incomplete

**Structure** : Simple  
**Abstraction** : Base

### Description

The code contains a callable or other code grouping in which the nesting / branching is too deep.

### Extended Description

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1125: Excessive Attack Surface

**Weakness ID** : 1125 **Status**: Incomplete  
**Structure** : Simple  
**Abstraction** : Base

### Description

The product has an attack surface whose quantitative measurement exceeds a desirable maximum.

### Extended Description

Originating from software security, an "attack surface" measure typically reflects the number of input points and output points that can be utilized by an untrusted party, i.e. a potential attacker. A larger attack surface provides more places to attack, and more opportunities for developers to introduce weaknesses. In some cases, this measure may reflect other aspects of quality besides

security; e.g., a product with many inputs and outputs may require a large number of tests in order to improve code coverage.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1126: Declaration of Variable with Unnecessarily Wide Scope

<b>Weakness ID :</b> 1126	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

### Description

The source code declares a variable in one scope, but the variable is only used within a narrower scope.

### Extended Description

This issue makes it more difficult to understand and/or maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Other	Reduce Maintainability	

**CWE-1127: Compilation with Insufficient Warnings or Errors****Weakness ID :** 1127**Status:** Incomplete**Structure :** Simple**Abstraction :** Base**Description**

The code is compiled without sufficient warnings enabled, which may prevent the detection of subtle bugs or quality issues.

**Extended Description**

This issue makes it more difficult to maintain the software, which indirectly affects security by making it more difficult or time-consuming to find and/or fix vulnerabilities. It also might make it easier to introduce vulnerabilities.

**Relationships**

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Scope	Impact	Likelihood
Other	Reduce Maintainability	

**CWE-1164: Irrelevant Code****Weakness ID :** 1164**Status:** Incomplete**Structure :** Simple**Abstraction :** Class**Description**

The program contains code that is not essential for execution, i.e. makes no state changes and has no side effects that alter data or control flow, such that removal of the code would have no impact to functionality or correctness.

### Extended Description

Irrelevant code could include dead code, initialization that is not used, empty blocks, code that could be entirely removed due to optimization, etc.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

Scope	Impact	Likelihood
Other	Reduce Reliability	
Other	Reduce Performance	

## CWE-1173: Improper Use of Validation Framework

<b>Weakness ID :</b> 1173	<b>Status:</b> Draft
<b>Structure :</b> Simple	
<b>Abstraction :</b> Base	

### Description

The application does not use, or incorrectly uses, an input validation framework that is provided by the source language or an independent library.

### Extended Description

Many modern coding languages provide developers with input validation frameworks to make the task of input validation easier and less error-prone. These frameworks will automatically check all input against specified criteria and direct execution to error handlers when invalid input is received. The improper use (i.e., an incorrect implementation or missing altogether) of these frameworks is not directly exploitable, but can lead to an exploitable condition if proper input validation is not performed later in the application. Not using provided input validation frameworks can also hurt the

maintainability of code as future developers may not recognize the downstream input validation being used in the place of the validation framework.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

*Relevant to the view "Research Concepts" (CWE-1000)*

ParentOf	☑	554	ASP.NET Misconfiguration: Not Using Input Validation Framework	1125
ParentOf	☑	1174	ASP.NET Misconfiguration: Improper Model Validation	1723

## Weakness Ordinalities

**Indirect :**

## Applicable Platforms

**Language :** Language-Independent (*Prevalence = Undetermined*)

## Common Consequences

Scope	Impact	Likelihood
Integrity	Unexpected State  <i>Unchecked input leads to cross-site scripting, process control, and SQL injection vulnerabilities, among others.</i>	

## Detection Methods

### Automated Static Analysis

Some instances of improper input validation can be detected using automated static analysis. A static analysis tool might allow the user to specify which application-specific methods or functions perform input validation; the tool might also have built-in knowledge of validation frameworks such as Struts. The tool may then suppress or de-prioritize any associated warnings. This allows

the analyst to focus on areas of the software in which input validation does not appear to be present. Except in the cases described in the previous paragraph, automated static analysis might not be able to recognize when proper input validation is being performed, leading to false positives - i.e., warnings that do not have any security consequences or require any code changes.

### Potential Mitigations

#### Phase: Implementation

Properly use provided input validation frameworks.

## CWE-1174: ASP.NET Misconfiguration: Improper Model Validation

**Weakness ID :** 1174

**Status:** Draft

**Structure :** Simple

**Abstraction :** Variant

### Description

The ASP.NET application does not use, or incorrectly uses, the model validation framework.

### Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1176: Inefficient CPU Computation

**Weakness ID :** 1176

**Status:** Incomplete

**Structure :** Simple

**Abstraction :** Class

### Description

The program performs CPU computations using algorithms that are not as efficient as they could be for the needs of the developer, i.e., the computations can be optimized further.

## Extended Description

This issue can make the software perform more slowly, possibly in ways that are noticeable to the users. If an attacker can influence the amount of computation that must be performed, e.g. by triggering worst-case complexity, then this performance problem might introduce a vulnerability.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOr and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

## CWE-1177: Use of Prohibited Code

<b>Weakness ID :</b> 1177	<b>Status:</b> Incomplete
<b>Structure :</b> Simple	
<b>Abstraction :</b> Class	

## Description

The software uses a function, library, or third party component that has been explicitly prohibited, whether by the developer or the customer.

## Extended Description

The developer - or customers - may wish to restrict or eliminate use of a function, library, or third party component for any number of reasons, including real or suspected vulnerabilities; difficulty to use securely; export controls or license requirements; obsolete or poorly-maintained code; internal code being scheduled for deprecation; etc.

To reduce risk of vulnerabilities, the developer might maintain a list of "banned" functions that programmers must avoid using because the functions are difficult or impossible to use securely. This issue can also make the software more costly and difficult to maintain.

## Relationships

The table(s) below shows the weaknesses and high level categories that are related to this weakness. These relationships are defined as ChildOf, ParentOf, MemberOf and give insight to similar items that may exist at higher and lower levels of abstraction. In addition, relationships such as PeerOf and CanAlsoBe are defined to show similar weaknesses that may want to be explored.

# Categories

## Category-2: 7PK - Environment

Category ID : 2

Status: Draft

## Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that are typically introduced during unexpected environmental conditions. According to the authors of the Seven Pernicious Kingdoms, "This section includes everything that is outside of the source code but is still critical to the security of the product that is being created. Because the issues covered by this kingdom are not directly related to source code, we separated it from the rest of the kingdoms."

## Membership

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
WASC	14		Server Misconfiguration
WASC	15		Application Misconfiguration

### Notes

#### Maintenance

This entry is a Category, but various sources map to it anyway, e.g. by NVD, despite CWE guidance that Categories should not be mapped. In this case, there are no clear CWE Weaknesses that can be utilized. "Inappropriate Configuration" might be better described as a Weakness, so this entry might be converted to a Weakness in a later version. Further research is required, however, as a "configuration weakness" might be Primary to many other CWEs, i.e., it might be better described in terms of chaining relationships.

## Category-17: Code

Category ID : 17 Status: Draft

### Summary

Weaknesses in this category are typically introduced during code development, including specification, design, and implementation.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1003	Weaknesses for Simplified Mapping of Published Vulnerabilities	1003	1910
HasMember	C	18	Source Code	1003	1728

## Notes

### Maintenance

This entry is being considered for deprecation. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree. It cannot be deprecated until after the CWE team has reviewed whether other CWE elements are appropriately capturing the "location" in which the weaknesses are introduced.

## Category-18: Source Code

Category ID : 18

Status: Draft

### Summary

Weaknesses in this category are typically found within source code.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	17	Code	1003	1727
HasMember	C	19	Data Processing Errors	1003	1728
HasMember	C	21	Pathname Traversal and Equivalence Errors	1003	1729

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
Landwehr			Source Code

## Notes

### Maintenance

This entry is being considered for deprecation. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree. It cannot be deprecated until after the CWE team has reviewed whether other CWE elements are appropriately capturing the "location" in which the weaknesses are introduced.

## Category-19: Data Processing Errors

Category ID : 19

Status: Draft

### Summary

Weaknesses in this category are typically found in functionality that processes data.

## Membership

## Category-21: Pathname Traversal and Equivalence Errors

Category ID : 21

Status: Incomplete

## Summary

Weaknesses in this category can be used to access files outside of a restricted directory (path traversal) or to perform operations on files that would otherwise be restricted (path equivalence). Files, directories, and folders are so central to information technology that many different weaknesses and variants have been discovered. The manipulations generally involve special characters or sequences in pathnames, or the use of alternate references or channels.

## Category-227: 7PK - API Abuse

Category ID : 227 Status: Draft

### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that involve the software using an API in a manner contrary to its intended use. According to the authors of the Seven Pernicious Kingdoms, "An API is a contract between a caller and a callee. The most common forms of API misuse occurs when the caller does not honor its end of this contract. For example, if a program does not call `chdir()` after calling `chroot()`, it violates the contract that specifies how to change the active root directory in a secure fashion. Another good example of library abuse is expecting the callee to return trustworthy DNS information to the caller. In this case, the caller misuses the callee API by making certain assumptions about its behavior (that the return value can be used for authentication purposes). One can also violate the caller-callee contract from the other side. For example, if a coder subclasses `SecureRandom` and returns a non-random value, the contract is violated."

HasMember	V	767	Access to Critical Private Variable via Public Method	699	1419

## Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Privilege / sandbox errors

## Notes

### Relationship

This can strongly overlap authorization errors.

### Theoretical

A sandbox could be regarded as an explicitly defined sphere of control, in that the sandbox only defines a limited set of behaviors, which can only access a limited set of resources.

### Theoretical

It could be argued that any privilege problem occurs within the context of a sandbox.

### Research Gap

Many of the following concepts require deeper study. Most privilege problems are not classified at such a low level of detail, and terminology is very sparse. Certain classes of software, such as web browsers and software bug trackers, provide a rich set of examples for further research. Operating systems have matured to the point that these kinds of weaknesses are rare, but finer-grained models for privileges, capabilities, or roles might introduce subtler issues.

## Category-275: Permission Issues

Category ID : 275

Status: Draft

## Summary

Weaknesses in this category are related to improper assignment or handling of permissions.

## Membership

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Cryptographic Issues

### Notes

#### Maintenance

This category is incomplete and needs refinement, as there is good documentation of cryptographic flaws and related attacks.

#### Maintenance

Relationships between CWE-310, CWE-326, and CWE-327 and all their children need to be reviewed and reorganized.

### Research Gap

User interface errors that are relevant to security have not been studied at a high level.

**Category-361: 7PK - Time and State**

Category ID : 361

Status: Incomplete

**Summary**

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses related to the improper management of time and state in an environment that supports simultaneous or near-simultaneous computation by multiple systems, processes, or threads. According to the authors of the Seven Pernicious Kingdoms, "Distributed computation is about time and state. That is, in order for more than one component to communicate, state must be shared, and all that takes time. Most programmers anthropomorphize their work. They think about one thread of control carrying out the entire program in the same way they would if they had to do the job themselves. Modern computers, however, switch between tasks very quickly, and in multi-core, multi-CPU, or distributed systems, two events may take place at exactly the same time. Defects rush to fill the gap between the programmer's model of how a program executes and what happens in reality. These defects are related to unexpected interactions between threads, processes, time, and information. These interactions happen through shared state: semaphores, variables, the file system, and, basically, anything that can store information."

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER			Signal Errors

### Notes

## Maintenance

Several sub-categories could exist, but this needs more study. Some sub-categories might be unhandled signals, untrusted signals, and sending the wrong signals.

## Category-388: 7PK - Errors

Category ID : 388

Status: Draft

### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that occur when an application does not properly handle errors that occur during processing. According to the authors of the Seven Pernicious Kingdoms, "Errors and error handling represent a class of API. Errors related to error handling are so common that they deserve a special kingdom of their own. As with 'API Abuse,' there are two ways to introduce an error-related security vulnerability: the most common one is handling errors poorly (or not at all). The second is producing errors that either give out too much information (to possible attackers) or are difficult to handle."

### Membership

## Category-389: Error Conditions, Return Values, Status Codes

Category ID : 389

Status: Incomplete

### Summary

This category includes weaknesses that occur if a function does not generate the correct return/status code, or if the application does not handle all possible return/status codes that could be generated by a function. This type of problem is most often found in conditions that are rarely encountered during the normal operation of the product. Presumably, most bugs related to common conditions are found and eliminated during development and testing. In some cases, the attacker can directly control or influence the environment to trigger the rare conditions.

HasMember	G	754	Improper Check for Unusual or Exceptional Conditions	1003	1381
HasMember	G	756	Missing Custom Error Page	699	1390

## Notes

### Other

Many researchers focus on the resultant weaknesses and do not necessarily diagnose whether a rare condition is the primary factor. However, since 2005 it seems to be reported more frequently than in the past. This subject needs more study.

## Category-398: 7PK - Code Quality

Category ID : 398

Status: Draft

## Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that do not directly introduce a weakness or vulnerability, but indicate that the product has not been carefully developed or maintained. According to the authors of the Seven Pernicious Kingdoms, "Poor code quality leads to unpredictable behavior. From a user's perspective that often manifests itself as poor usability. For an adversary it provides an opportunity to stress the system in unexpected ways."

HasMember	C	514	Covert Channel	699	1083

### Taxonomy Mappings

Mapped Taxonomy Name	Node ID	Fit	Mapped Node Name
PLOVER	CHAP.VIRTFILE		Channel and Path Errors

### Notes

## Relationship

A number of vulnerabilities are specifically related to problems in creating, managing, or removing alternate channels and alternate paths. Some of these can overlap virtual file problems. They are commonly used in "bypass" attacks, such as those that exploit authentication errors.

## Maintenance

This category is being considered for deprecation. It is not clear whether communication channels are related closely enough to access paths. In addition, the "path" term is probably assumed by many readers to be associated with file paths, as opposed to the original meaning as intended in PLOVER.

## Research Gap

Most of these issues are probably under-studied. Only a handful of public reports exist.

## Category-429: Handler Errors

Category ID : 429

Status: Draft

### Summary

Weaknesses in this category are related to improper management of handlers.

## Category-485: 7PK - Encapsulation

Category ID : 485 Status: Draft

### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that occur when the product does not sufficiently encapsulate critical data or functionality. According to the authors of the Seven Pernicious Kingdoms, "Encapsulation is about drawing strong boundaries. In a web browser that might mean ensuring that your mobile code cannot be abused by other mobile code. On the server it might mean differentiation between validated data and unvalidated data, between one user's data and another's, or between data users are allowed to see and data that they are not."

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	700	Seven Pernicious Kingdoms	700	1891

Nature	Type	ID	Name	V	Page
HasMember	V	486	Comparison of Classes by Name	700	1034
HasMember	V	488	Exposure of Data Element to Wrong Session	700	1038
HasMember	B	489	Leftover Debug Code	700	1040
HasMember	V	491	Public cloneable() Method Without Final ('Object Hijack')	700	1042
HasMember	V	492	Use of Inner Class Containing Sensitive Data	700	1043
HasMember	V	493	Critical Public Variable Without Final Modifier	700	1050
HasMember	V	495	Private Data Structure Returned From A Public Method	700	1056
HasMember	V	496	Public Data Assigned to Private Array-Typed Field	700	1058
HasMember	V	497	Exposure of System Data to an Unauthorized Control Sphere	700	1059
HasMember	B	501	Trust Boundary Violation	700	1068
HasMember	B	749	Exposed Dangerous Method or Function	1003	1377

## Notes

### Other

The "encapsulation" term is used in multiple ways. Within some security sources, the term is used to describe the establishment of boundaries between different control spheres. Within general computing circles, it is more about hiding implementation details and maintainability than security. Even within the security usage, there is also a question of whether "encapsulation" encompasses the entire range of security problems.

HasMember	V	572	Call to Thread run() instead of start()	699	1150

## Category-559: Often Misused: Arguments and Parameters

Category ID : 559

Status: Draft

## Summary

Weaknesses in this category are related to improper use of arguments or parameters within function calls.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Development Concepts	699	1890
HasMember	V	560	Use of umask() with chmod-style Argument	699	1129
HasMember	B	628	Function Call with Incorrectly Specified Arguments	699	1242

## Notes

### Relationship

This category is closely related to CWE-628, Incorrectly Specified Arguments, and might be the same. However, CWE-628 is a base weakness, not a category.

## Category-569: Expression Issues

Category ID : 569

Status: Draft

## Summary

Weaknesses in this category are related to incorrectly written expressions within code.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Development Concepts	699	1890

## Category-735: CERT C Secure Coding Standard (2008) Chapter 2 - Preprocessor (PRE)

Category ID : 735

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Preprocessor (PRE) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	G	684	Incorrect Provision of Specified Functionality	734	1331

## Notes

## Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-684 PRE09-C Do not replace secure functions with less secure functions

## References

[REF-597]Robert C. Seacord. "The CERT C Secure Coding Standard". 1st Edition. 2008 October 4. Addison-Wesley Professional.

## Category-736: CERT C Secure Coding Standard (2008) Chapter 3 - Declarations and Initialization (DCL)

Category ID : 736

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Declarations and Initialization (DCL) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	Page	Page
MemberOf		734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember		547	Use of Hard-coded, Security-relevant Constants	734	1117
HasMember		628	Function Call with Incorrectly Specified Arguments	734	1242
HasMember		686	Function Call With Incorrect Argument Type	734	1334

### Notes

#### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-547 DCL06-C Use meaningful symbolic constants to represent literal values in program logic CWE-628 DCL10-C Maintain the contract between the writer and caller of variadic functions CWE-686 DCL35-C Do not invoke a function using a type that does not match the function definition

## Category-737: CERT C Secure Coding Standard (2008) Chapter 4 - Expressions (EXP)

Category ID : 737

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Expressions (EXP) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	V	467	Use of sizeof() on a Pointer Type	734	989
HasMember	B	468	Incorrect Pointer Scaling	734	992
HasMember	B	476	NULL Pointer Dereference	734	1008
HasMember	B	628	Function Call with Incorrectly Specified Arguments	734	1242
HasMember	G	704	Incorrect Type Conversion or Cast	734	1358
HasMember	V	783	Operator Precedence Logic Error	734	1455

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-467 EXP01-C Do not take the size of a pointer to determine the size of the pointed-to type CWE-468 EXP08-C Ensure pointer arithmetic is used correctly CWE-476 EXP34-C Ensure a null pointer is not dereferenced CWE-628 EXP37-C Call functions with the arguments intended by the API CWE-704 EXP05-C Do not cast away a const qualification CWE-783 EXP00-C Use parentheses for precedence of operation

## Category-738: CERT C Secure Coding Standard (2008) Chapter 5 - Integers (INT)

Category ID : 738

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Integers (INT) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	G	20	Improper Input Validation	734	18
HasMember	B	129	Improper Validation of Array Index	734	316
HasMember	B	190	Integer Overflow or Wraparound	734	445
HasMember	G	192	Integer Coercion Error	734	454
HasMember	B	197	Numeric Truncation Error	734	469
HasMember	B	369	Divide By Zero	734	817
HasMember	B	466	Return of Pointer Value Outside of Expected Range	734	987
HasMember	B	587	Assignment of a Fixed Address to a Pointer	734	1174
HasMember	B	606	Unchecked Input for Loop Condition	734	1206
HasMember	B	676	Use of Potentially Dangerous Function	734	1317
HasMember	G	681	Incorrect Conversion between Numeric Types	734	1322
HasMember	G	682	Incorrect Calculation	734	1325

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 INT06-C Use strtol() or a related function to convert a string token to an integer CWE-129 INT32-C Ensure that operations on signed integers do not result in overflow CWE-190 INT03-C Use a secure integer library CWE-190 INT30-C Ensure that unsigned integer operations do not wrap CWE-190 INT32-C Ensure that operations on signed integers do not result in overflow CWE-190 INT35-C Evaluate integer expressions in a larger size before comparing or assigning to that size CWE-192 INT02-C Understand integer conversion rules CWE-192 INT05-C Do not use input functions to convert character data if they cannot handle all possible inputs CWE-192 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-197 INT02-C Understand integer conversion rules CWE-197 INT05-C Do not use input functions to convert character data if they cannot handle all possible inputs CWE-197 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-369 INT33-C Ensure that division and modulo operations do not result in divide-by-zero errors CWE-466 INT11-C Take care when converting from pointer to integer or integer to pointer CWE-587 INT11-C Take care when converting from pointer to integer or integer to pointer CWE-606 INT03-C Use a secure integer library CWE-676 INT06-C Use strtol() or a related function to convert a string token to an integer CWE-681 INT15-C Use intmax\_t or uintmax\_t for formatted IO on programmer-defined integer types CWE-681 INT31-C Ensure that integer conversions do not result in lost or misinterpreted data CWE-681 INT35-C Evaluate integer expressions in a larger size before comparing or assigning to that size CWE-682 INT07-C Use only explicitly signed or unsigned char type for numeric values CWE-682 INT13-C Use bitwise operators only on unsigned operands

## Category-739: CERT C Secure Coding Standard (2008) Chapter 6 - Floating Point (FLP)

Category ID : 739

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Floating Point (FLP) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	W	Page
MemberOf	W	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	B	369	Divide By Zero	734	817
HasMember	G	681	Incorrect Conversion between Numeric Types	734	1322
HasMember	G	682	Incorrect Calculation	734	1325
HasMember	V	686	Function Call With Incorrect Argument Type	734	1334

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-369 FLP03-C Detect and handle floating point errors CWE-681 FLP33-C Convert integers to floating point for floating point operations CWE-681 FLP34-C Ensure that floating point conversions are within range of the new type CWE-682 FLP32-C Prevent or detect domain and range errors in math functions CWE-682 FLP33-C Convert

integers to floating point for floating point operations  
 CWE-686 FLP31-C Do not call functions expecting real values with complex values

## Category-740: CERT C Secure Coding Standard (2008) Chapter 7 - Arrays (ARR)

Category ID : 740

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Arrays (ARR) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	276
HasMember	B	129	Improper Validation of Array Index	734	316
HasMember	V	467	Use of sizeof() on a Pointer Type	734	989
HasMember	B	469	Use of Pointer Subtraction to Determine Size	734	993
HasMember	G	665	Improper Initialization	734	1293
HasMember	B	805	Buffer Access with Incorrect Length Value	734	1495

### Notes

#### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-119 ARR00-C Understand how arrays work  
 CWE-119 ARR33-C Guarantee that copies are made into storage of sufficient size  
 CWE-119 ARR34-C Ensure that array types in expressions are compatible  
 CWE-119 ARR35-C Do not allow loops to iterate beyond the end of an array  
 CWE-129 ARR00-C Understand how arrays work  
 CWE-129 ARR30-C Guarantee that array indices are within the valid range  
 CWE-129 ARR38-C Do not add or subtract an integer to a pointer if the resulting value does not refer to a valid array element  
 CWE-467 ARR01-C Do not apply the sizeof operator to a pointer when taking the size of an array  
 CWE-469 ARR36-C Do not subtract or compare two pointers that do not refer to the same array  
 CWE-469 ARR37-C Do not add or subtract an integer to a pointer to a non-array object  
 CWE-665 ARR02-C Explicitly specify array bounds, even if implicitly defined by an initializer  
 CWE-805 ARR33-C Guarantee that copies are made into storage of sufficient size

## Category-741: CERT C Secure Coding Standard (2008) Chapter 8 - Characters and Strings (STR)

Category ID : 741

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Characters and Strings (STR) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	734	145
HasMember	B	88	Argument Injection or Modification	734	186
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	276
HasMember	B	120	Buffer Copy without Checking Size of Input ('Classic Buffer Overflow')	734	286
HasMember	B	135	Incorrect Calculation of Multi-Byte String Length	734	344
HasMember	B	170	Improper Null Termination	734	403
HasMember	B	193	Off-by-one Error	734	457
HasMember	B	464	Addition of Data Structure Sentinel	734	986
HasMember	V	686	Function Call With Incorrect Argument Type	734	1334
HasMember	G	704	Incorrect Type Conversion or Cast	734	1358

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-78 STR02-C Sanitize data passed to complex subsystems CWE-88 STR02-C Sanitize data passed to complex subsystems CWE-119 STR31-C Guarantee that storage for strings has sufficient space for character data and the null terminator CWE-119 STR32-C Null-terminate byte strings as required CWE-119 STR33-C Size wide character strings correctly CWE-120 STR35-C Do not copy data from an unbounded source to a fixed-length array CWE-135 STR33-C Size wide character strings correctly CWE-170 STR03-C Do not inadvertently truncate a null-terminated byte string CWE-170 STR32-C Null-terminate byte strings as required CWE-193 STR31-C Guarantee that storage for strings has sufficient space for character data and the null terminator CWE-464 STR03-C Do not inadvertently truncate a null-terminated byte string CWE-464 STR06-C Do not assume that strtok() leaves the parse string unchanged CWE-686 STR37-C Arguments to character handling functions must be representable as an unsigned char CWE-704 STR34-C Cast characters to unsigned types before converting to larger integer sizes CWE-704 STR37-C Arguments to character handling functions must be representable as an unsigned char

HasMember	V	687	Function Call With Incorrectly Specified Argument Value	734	1335
HasMember	G	754	Improper Check for Unusual or Exceptional Conditions	734	1381

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 MEM10-C Define and use a pointer validation function  
 CWE-119 MEM09-C Do not assume memory allocation routines initialize memory  
 CWE-128 MEM07-C Ensure that the arguments to `calloc()`, when multiplied, can be represented as a `size_t`  
 CWE-131 MEM35-C Allocate sufficient memory for an object  
 CWE-190 MEM07-C Ensure that the arguments to `calloc()`, when multiplied, can be represented as a `size_t`  
 CWE-190 MEM35-C Allocate sufficient memory for an object  
 CWE-226 MEM03-C Clear sensitive information stored in reusable resources returned for reuse  
 CWE-244 MEM03-C Clear sensitive information stored in reusable resources returned for reuse  
 CWE-252 MEM32-C Detect and handle memory allocation errors  
 CWE-415 MEM00-C Allocate and free memory in the same module, at the same level of abstraction  
 CWE-415 MEM01-C Store a new value in pointers immediately after `free()`  
 CWE-415 MEM31-C Free dynamically allocated memory exactly once  
 CWE-416 MEM00-C Allocate and free memory in the same module, at the same level of abstraction  
 CWE-416 MEM01-C Store a new value in pointers immediately after `free()`  
 CWE-416 MEM30-C Do not access freed memory  
 CWE-476 MEM32-C Detect and handle memory allocation errors  
 CWE-528 MEM06-C Ensure that sensitive data is not written out to disk  
 CWE-590 MEM34-C Only free memory allocated dynamically  
 CWE-591 MEM06-C Ensure that sensitive data is not written out to disk  
 CWE-628 MEM08-C Use `realloc()` only to resize dynamically allocated arrays  
 CWE-665 MEM09-C Do not assume memory allocation routines initialize memory  
 CWE-687 MEM04-C Do not perform zero length allocations  
 CWE-754 MEM32-C Detect and handle memory allocation errors

## Category-743: CERT C Secure Coding Standard (2008) Chapter 10 - Input Output (FIO)

Category ID : 743

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Input Output (FIO) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	G	22	Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	734	30
HasMember	V	37	Path Traversal: '/absolute/pathname/here'	734	74
HasMember	V	38	Path Traversal: '\absolute\pathname\here'	734	76
HasMember	V	39	Path Traversal: 'C:\dirname'	734	77
HasMember	B	41	Improper Resolution of Path Equivalence	734	82
HasMember	B	59	Improper Link Resolution Before File Access ('Link Following')	734	108
HasMember	V	62	UNIX Hard Link	734	115
HasMember	V	64	Windows Shortcut Following (.LNK)	734	117
HasMember	V	65	Windows Hard Link	734	119
HasMember	V	67	Improper Handling of Windows Device Names	734	122
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	276
HasMember	B	134	Use of Externally-Controlled Format String	734	339
HasMember	B	241	Improper Handling of Unexpected Data Type	734	538
HasMember	V	276	Incorrect Default Permissions	734	606
HasMember	V	279	Incorrect Execution-Assigned Permissions	734	611
HasMember	G	362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	734	793
HasMember	B	367	Time-of-check Time-of-use (TOCTOU) Race Condition	734	811
HasMember	B	379	Creation of Temporary File in Directory with Incorrect Permissions	734	833
HasMember	B	391	Unchecked Error Condition	734	849
HasMember	B	403	Exposure of File Descriptor to Unintended Control Sphere ('File Descriptor Leak')	734	874
HasMember	G	404	Improper Resource Shutdown or Release	734	876
HasMember	B	552	Files or Directories Accessible to External Parties	734	1122
HasMember	G	675	Duplicate Operations on Resource	734	1316
HasMember	B	676	Use of Potentially Dangerous Function	734	1317
HasMember	V	686	Function Call With Incorrect Argument Type	734	1334
HasMember	G	732	Incorrect Permission Assignment for Critical Resource	734	1367

### Notes

#### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-22 FIO02-C Canonicalize path names originating from untrusted sources CWE-37 FIO05-C Identify files using multiple file attributes CWE-38 FIO05-C Identify files using multiple file attributes CWE-39 FIO05-C Identify files using multiple file attributes CWE-41 FIO02-C Canonicalize path names originating from untrusted sources CWE-59 FIO02-C Canonicalize path names originating from untrusted sources CWE-62 FIO05-C Identify files using multiple file attributes CWE-64 FIO05-C Identify files using multiple file attributes CWE-65 FIO05-C Identify files using multiple file attributes CWE-67 FIO32-C Do not perform operations on devices that are only appropriate for files CWE-119 FIO37-C Do not assume character data has been read CWE-134 FIO30-C Exclude user input from format strings CWE-134 FIO30-C Exclude user input from format strings CWE-241 FIO37-C Do not assume character data has been read CWE-276 FIO06-C Create files with appropriate access permissions CWE-279 FIO06-C Create files with appropriate access permissions CWE-362 FIO31-C Do not simultaneously open the same file multiple times CWE-367 FIO01-C Be careful using functions that use file names for identification CWE-379 FIO15-C Ensure that file operations are performed in a secure directory CWE-379 FIO43-C Do not create temporary files in shared directories CWE-391 FIO04-C Detect and handle input and output errors CWE-391 FIO33-C Detect and handle input output errors resulting in undefined behavior CWE-403 FIO42-C Ensure files are properly closed when they are no longer needed CWE-404 FIO42-C Ensure files are properly closed when they are no longer needed CWE-552 FIO15-C Ensure that file operations are performed in a secure directory CWE-675 FIO31-C Do not simultaneously open the same file multiple times CWE-676 FIO01-C Be careful using functions that use file names for identification CWE-686 FIO00-C Take care when creating format strings CWE-732 FIO06-C Create files with appropriate access permissions

## Category-744: CERT C Secure Coding Standard (2008) Chapter 11 - Environment (ENV)

Category ID : 744

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Environment (ENV) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	734	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	734	145
HasMember	B	88	Argument Injection or Modification	734	186
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	734	276
HasMember	B	426	Untrusted Search Path	734	917
HasMember	B	462	Duplicate Key in Associative List (Alist)	734	982
HasMember	G	705	Incorrect Control Flow Scoping	734	1359

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-78 ENV03-C Sanitize the environment when invoking external programs CWE-78 ENV04-C Do not call system() if you do not need a command processor CWE-88 ENV03-C Sanitize the environment when invoking external programs CWE-88 ENV04-C Do not call system() if you do not need a command processor CWE-119 ENV01-C Do not make assumptions about the size of an environment variable CWE-426 ENV03-C Sanitize the environment when invoking external programs CWE-462 ENV02-C Beware of multiple environment variables with the same effective name CWE-705 ENV32-C All atexit handlers must return normally

## Category-745: CERT C Secure Coding Standard (2008) Chapter 12 - Signals (SIG)

Category ID : 745

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Signals (SIG) chapter of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	Page	Page
MemberOf	✓	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	✓	479	Signal Handler Use of a Non-reentrant Function	734	1019
HasMember	ⓑ	662	Improper Synchronization	734	1288

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-432 SIG00-C Mask signals handled by noninterruptible signal handlers CWE-479 SIG30-C Call only asynchronous-safe functions within signal handlers CWE-479 SIG32-C Do not call longjmp() from inside a signal handler CWE-479 SIG33-C Do not recursively invoke the raise() function CWE-479 SIG34-C Do not call signal() from within interruptible signal handlers CWE-662 SIG00-C Mask signals handled by noninterruptible signal handlers CWE-662 SIG31-C Do not access or modify shared objects in signal handlers CWE-828 SIG31-C Do not access or modify shared objects in signal handlers

## Category-746: CERT C Secure Coding Standard (2008) Chapter 13 - Error Handling (ERR)

Category ID : 746

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the Error Handling (ERR) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	G	20	Improper Input Validation	734	18
HasMember	B	391	Unchecked Error Condition	734	849
HasMember	B	544	Missing Standardized Error Handling Mechanism	734	1114
HasMember	B	676	Use of Potentially Dangerous Function	734	1317
HasMember	G	705	Incorrect Control Flow Scoping	734	1359

### Notes

#### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-20 ERR07-C Prefer functions that support error checking over equivalent functions that don't CWE-391 ERR00-C Adopt and implement a consistent and comprehensive error-handling policy CWE-544 ERR00-C Adopt and implement a consistent and comprehensive error-handling policy CWE-676 ERR07-C Prefer functions that support error checking over equivalent functions that don't CWE-705 ERR04-C Choose an appropriate termination strategy

## Category-747: CERT C Secure Coding Standard (2008) Chapter 14 - Miscellaneous (MSC)

Category ID : 747

Status: Obsolete

### Summary

Weaknesses in this category are related to the rules and recommendations in the Miscellaneous (MSC) chapter of the CERT C Secure Coding Standard (2008).

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember	V	14	Compiler Removal of Code to Clear Buffers	734	13
HasMember	G	20	Improper Input Validation	734	18
HasMember	V	176	Improper Handling of Unicode Encoding	734	415
HasMember	G	330	Use of Insufficiently Random Values	734	729
HasMember	B	480	Use of Incorrect Operator	734	1021
HasMember	V	482	Comparing instead of Assigning	734	1027
HasMember	V	561	Dead Code	734	1130
HasMember	V	563	Assignment to Variable without Use	734	1135
HasMember	V	570	Expression is Always False	734	1145
HasMember	V	571	Expression is Always True	734	1148
HasMember	G	697	Incorrect Comparison	734	1350

Nature	Type	ID	Name	V	Page
HasMember		704	Incorrect Type Conversion or Cast	734	1358

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-14 MSC06-C Be aware of compiler optimization when dealing with sensitive data CWE-20 MSC08-C Library functions should validate their parameters CWE-176 MSC10-C Character Encoding - UTF8 Related Issues CWE-330 MSC30-C Do not use the rand() function for generating pseudorandom numbers CWE-480 MSC02-C Avoid errors of omission CWE-480 MSC03-C Avoid errors of addition CWE-482 MSC02-C Avoid errors of omission CWE-561 MSC07-C Detect and remove dead code CWE-563 MSC00-C Compile cleanly at high warning levels CWE-570 MSC00-C Compile cleanly at high warning levels CWE-571 MSC00-C Compile cleanly at high warning levels CWE-697 MSC31-C Ensure that return values are compared against the proper type CWE-704 MSC31-C Ensure that return values are compared against the proper type CWE-758 MSC14-C Do not introduce unnecessary platform dependencies CWE-758 MSC15-C Do not depend on undefined behavior

## Category-748: CERT C Secure Coding Standard (2008) Appendix - POSIX (POS)

Category ID : 748

Status: Obsolete

## Summary

Weaknesses in this category are related to the rules and recommendations in the POSIX (POS) appendix of the CERT C Secure Coding Standard (2008).

## Membership

Nature	Type	ID	Name	V	Page
MemberOf		734	Weaknesses Addressed by the CERT C Secure Coding Standard (2008)	734	1894
HasMember		59	Improper Link Resolution Before File Access ('Link Following')	734	108
HasMember		170	Improper Null Termination	734	403
HasMember		242	Use of Inherently Dangerous Function	734	540
HasMember		272	Least Privilege Violation	734	598
HasMember		273	Improper Check for Dropped Privileges	734	602
HasMember		363	Race Condition Enabling Link Following	734	800
HasMember		366	Race Condition within a Thread	734	809
HasMember		562	Return of Stack Variable Address	734	1134
HasMember		667	Improper Locking	734	1300
HasMember		686	Function Call With Incorrect Argument Type	734	1334
HasMember		696	Incorrect Behavior Order	734	1349

## Notes

### Relationship

In the 2008 version of the CERT C Secure Coding standard, the following rules were mapped to the following CWE IDs: CWE-59 POS01-C Check for the existence of links when dealing with files CWE-170 POS30-C Use the readlink() function properly CWE-242 POS33-C Do not use vfork() CWE-272 POS02-C Follow the principle of least privilege CWE-273 POS37-C Ensure that privilege relinquishment is successful CWE-363 POS35-C Avoid race conditions while checking for the existence of a symbolic link CWE-366 POS00-C Avoid race conditions with multiple threads CWE-562 POS34-C Do not call putenv() with a pointer to an automatic variable as the argument CWE-667 POS31-C Do not unlock or destroy another thread's mutex CWE-686 POS34-C Do not call putenv() with a pointer to an automatic variable as the argument CWE-696 POS36-C Observe correct revocation order while relinquishing privileges

## Category-840: Business Logic Errors

Category ID : 840

Status: Incomplete

### Summary

Weaknesses in this category identify some of the underlying problems that commonly allow attackers to manipulate the business logic of an application. Errors in business logic can be devastating to an entire application. They can be difficult to find automatically, since they typically involve legitimate use of the application's functionality. However, many business logic errors can exhibit patterns that are similar to well-understood implementation and design weaknesses.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	699	Development Concepts	699	1890

HasMember	G	799	Improper Control of Interaction Frequency	699	1491
HasMember	B	841	Improper Enforcement of Behavioral Workflow	699	1556

## Notes

### Research Gap

The classification of business logic flaws has been under-studied, although exploitation of business flaws frequently happens in real-world systems, and many applied vulnerability researchers investigate them. The greatest focus is in web applications. There is debate within the community about whether these problems represent particularly new concepts, or if they are variations of well-known principles. Many business logic flaws appear to be oriented toward business processes, application flows, and sequences of behaviors, which are not as well-represented in CWE as weaknesses related to input validation, memory management, etc.

## Category-878: CERT C++ Secure Coding Section 10 - Environment (ENV)

Category ID : 878

Status: Incomplete

### Summary

Weaknesses in this category are related to rules in the Environment (ENV) section of the CERT C++ Secure Coding Standard. Since not all rules map to specific weaknesses, this category may be incomplete.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	868	Weaknesses Addressed by the SEI CERT C++ Coding Standard (2016 Version)	868	1900
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	868	145
HasMember	B	88	Argument Injection or Modification	868	186
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	868	276
HasMember	B	426	Untrusted Search Path	868	917
HasMember	B	462	Duplicate Key in Associative List (Alist)	868	982
HasMember	G	705	Incorrect Control Flow Scoping	868	1359
HasMember	B	807	Reliance on Untrusted Inputs in a Security Decision	868	1505

**Category-885: SFP Primary Cluster: Risky Values**

Category ID : 885

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Risky Values cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	998	SFP Secondary Cluster: Glitch in Computation	888	1840

**Category-886: SFP Primary Cluster: Unused entities**

Category ID : 886

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Unused entities cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	V	482	Comparing instead of Assigning	888	1027
HasMember	V	561	Dead Code	888	1130
HasMember	V	563	Assignment to Variable without Use	888	1135

## Category-887: SFP Primary Cluster: API

Category ID : 887

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the API cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	1001	SFP Secondary Cluster: Use of an Improper API	888	1841

## Category-889: SFP Primary Cluster: Exception Management

Category ID : 889

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Exception Management cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	960	SFP Secondary Cluster: Ambiguous Exception Type	888	1821
HasMember	C	961	SFP Secondary Cluster: Incorrect Exception Behavior	888	1821
HasMember	C	962	SFP Secondary Cluster: Unchecked Status Condition	888	1822

## Category-890: SFP Primary Cluster: Memory Access

Category ID : 890

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Memory Access cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	970	SFP Secondary Cluster: Faulty Buffer Access	888	1826
HasMember	C	971	SFP Secondary Cluster: Faulty Pointer Use	888	1827
HasMember	C	972	SFP Secondary Cluster: Faulty String Expansion	888	1827
HasMember	C	973	SFP Secondary Cluster: Improper NULL Termination	888	1827
HasMember	C	974	SFP Secondary Cluster: Incorrect Buffer Length Computation	888	1828

## Category-891: SFP Primary Cluster: Memory Management

Category ID : 891

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Memory Management cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	969	SFP Secondary Cluster: Faulty Memory Release	888	1826

**Category-892: SFP Primary Cluster: Resource Management**

Category ID : 892

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Resource Management cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	982	SFP Secondary Cluster: Failure to Release Resource	888	1832
HasMember	C	983	SFP Secondary Cluster: Faulty Resource Use	888	1832
HasMember	C	984	SFP Secondary Cluster: Life Cycle	888	1833
HasMember	C	985	SFP Secondary Cluster: Unrestricted Consumption	888	1833

**Category-893: SFP Primary Cluster: Path Resolution**

Category ID : 893

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Path Resolution cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	979	SFP Secondary Cluster: Failed Chroot Jail	888	1830
HasMember	C	980	SFP Secondary Cluster: Link in Resource Name Resolution	888	1830
HasMember	C	981	SFP Secondary Cluster: Path Traversal	888	1831

**Category-894: SFP Primary Cluster: Synchronization**

Category ID : 894

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Synchronization cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	986	SFP Secondary Cluster: Missing Lock	888	1833
HasMember	C	987	SFP Secondary Cluster: Multiple Locks/Unlocks	888	1834
HasMember	C	988	SFP Secondary Cluster: Race Condition Window	888	1834

Nature	Type	ID	Name	V	Page
HasMember	C	989	SFP Secondary Cluster: Unrestricted Lock	888	1835

## Category-895: SFP Primary Cluster: Information Leak

Category ID : 895

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Information Leak cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	963	SFP Secondary Cluster: Exposed Data	888	1822
HasMember	C	964	SFP Secondary Cluster: Exposure Temporary File	888	1824
HasMember	C	965	SFP Secondary Cluster: Insecure Session Management	888	1825
HasMember	C	966	SFP Secondary Cluster: Other Exposures	888	1825
HasMember	C	967	SFP Secondary Cluster: State Disclosure	888	1825

## Category-896: SFP Primary Cluster: Tainted Input

Category ID : 896

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Tainted Input cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	990	SFP Secondary Cluster: Tainted Input to Command	888	1835
HasMember	C	991	SFP Secondary Cluster: Tainted Input to Environment	888	1837
HasMember	C	992	SFP Secondary Cluster: Faulty Input Transformation	888	1838
HasMember	C	993	SFP Secondary Cluster: Incorrect Input Handling	888	1838
HasMember	C	994	SFP Secondary Cluster: Tainted Input to Variable	888	1839

## Category-897: SFP Primary Cluster: Entry Points

Category ID : 897

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Entry Points cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	1002	SFP Secondary Cluster: Unexpected Entry Points	888	1842

## Category-898: SFP Primary Cluster: Authentication

Category ID : 898

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Authentication cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	947	SFP Secondary Cluster: Authentication Bypass	888	1816
HasMember	C	948	SFP Secondary Cluster: Digital Certificate	888	1817
HasMember	C	949	SFP Secondary Cluster: Faulty Endpoint Authentication	888	1817
HasMember	C	950	SFP Secondary Cluster: Hardcoded Sensitive Data	888	1818
HasMember	C	951	SFP Secondary Cluster: Insecure Authentication Policy	888	1818
HasMember	C	952	SFP Secondary Cluster: Missing Authentication	888	1818
HasMember	C	953	SFP Secondary Cluster: Missing Endpoint Authentication	888	1819
HasMember	C	954	SFP Secondary Cluster: Multiple Binds to the Same Port	888	1819
HasMember	C	955	SFP Secondary Cluster: Unrestricted Authentication	888	1819

## Category-899: SFP Primary Cluster: Access Control

Category ID : 899

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Access Control cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	C	944	SFP Secondary Cluster: Access Management	888	1815
HasMember	C	945	SFP Secondary Cluster: Insecure Resource Access	888	1816
HasMember	C	946	SFP Secondary Cluster: Insecure Resource Permissions	888	1816

## Category-901: SFP Primary Cluster: Privilege

Category ID : 901

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Privilege cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	888	Software Fault Pattern (SFP) Clusters	888	1906
HasMember	V	9	J2EE Misconfiguration: Weak Access Permissions for EJB Methods	888	7
HasMember	C	250	Execution with Unnecessary Privileges	888	550

## Category-937: OWASP Top Ten 2013 Category A9 - Using Components with Known Vulnerabilities

Category ID : 937

Status: Obsolete

## Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2013.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	928	Weaknesses in OWASP Top Ten (2013)	928	1908

## Notes

### Relationship

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

## Category-944: SFP Secondary Cluster: Access Management

Category ID : 944

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Access Management cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	899	SFP Primary Cluster: Access Control	888	1808
HasMember	C	282	Improper Ownership Management	888	616
HasMember	B	283	Unverified Ownership	888	618
HasMember	C	284	Improper Access Control	888	619

Nature	Type	ID	Name	V	Page
HasMember		286	Incorrect User Management	888	629
HasMember		708	Incorrect Ownership Assignment	888	1364

## Category-945: SFP Secondary Cluster: Insecure Resource Access

Category ID : 945

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Resource Access cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf		899	SFP Primary Cluster: Access Control	888	1808
HasMember		285	Improper Authorization	888	622
HasMember		424	Improper Protection of Alternate Path	888	913
HasMember		639	Authorization Bypass Through User-Controlled Key	888	1250
HasMember		650	Trusting HTTP Permission Methods on the Server Side	888	1275

## Category-946: SFP Secondary Cluster: Insecure Resource Permissions

Category ID : 946

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Resource Permissions cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf		899	SFP Primary Cluster: Access Control	888	1808
HasMember		276	Incorrect Default Permissions	888	606
HasMember		277	Insecure Inherited Permissions	888	609
HasMember		278	Insecure Preserved Inherited Permissions	888	610
HasMember		279	Incorrect Execution-Assigned Permissions	888	611
HasMember		281	Improper Preservation of Permissions	888	615
HasMember		560	Use of umask() with chmod-style Argument	888	1129
HasMember		732	Incorrect Permission Assignment for Critical Resource	888	1367

## Category-947: SFP Secondary Cluster: Authentication Bypass

Category ID : 947

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Authentication Bypass cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	G	287	Improper Authentication	888	630
HasMember	B	288	Authentication Bypass Using an Alternate Path or Channel	888	636
HasMember	V	289	Authentication Bypass by Alternate Name	888	638
HasMember	B	303	Incorrect Implementation of Authentication Algorithm	888	669
HasMember	B	304	Missing Critical Step in Authentication	888	670
HasMember	B	305	Authentication Bypass by Primary Weakness	888	672
HasMember	B	308	Use of Single-factor Authentication	888	681
HasMember	B	309	Use of Password System for Primary Authentication	888	683
HasMember	B	603	Use of Client-Side Authentication	888	1203

## Category-948: SFP Secondary Cluster: Digital Certificate

Category ID : 948

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Digital Certificate cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	B	296	Improper Following of a Certificate's Chain of Trust	888	652
HasMember	V	297	Improper Validation of Certificate with Host Mismatch	888	655
HasMember	V	298	Improper Validation of Certificate Expiration	888	658
HasMember	B	299	Improper Check for Certificate Revocation	888	660
HasMember	V	593	Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created	888	1182
HasMember	V	599	Missing Validation of OpenSSL Certificate	888	1191

## Category-949: SFP Secondary Cluster: Faulty Endpoint Authentication

Category ID : 949

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Endpoint Authentication cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	V	293	Using Referer Field for Authentication	888	645
HasMember	V	302	Authentication Bypass by Assumed-Immutable Data	888	667
HasMember	G	345	Insufficient Verification of Data Authenticity	888	758
HasMember	B	346	Origin Validation Error	888	761
HasMember	V	350	Reliance on Reverse DNS Resolution for a Security-Critical Action	888	769
HasMember	B	360	Trust of System Event Data	888	791

Nature	Type	ID	Name	V	Page
HasMember	B	551	Incorrect Behavior Order: Authorization Before Parsing and Canonicalization	888	1121
HasMember	B	565	Reliance on Cookies without Validation and Integrity Checking	888	1138
HasMember	V	647	Use of Non-Canonical URL Paths for Authorization Decisions	888	1269

## Category-950: SFP Secondary Cluster: Hardcoded Sensitive Data

Category ID : 950

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Hardcoded Sensitive Data cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	V	258	Empty Password in Configuration File	888	570
HasMember	B	259	Use of Hard-coded Password	888	571
HasMember	B	321	Use of Hard-coded Cryptographic Key	888	708
HasMember	V	547	Use of Hard-coded, Security-relevant Constants	888	1117

## Category-951: SFP Secondary Cluster: Insecure Authentication Policy

Category ID : 951

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Authentication Policy cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	V	262	Not Using Password Aging	888	580
HasMember	B	263	Password Aging with Long Expiration	888	581
HasMember	B	521	Weak Password Requirements	888	1086
HasMember	V	556	ASP.NET Misconfiguration: Use of Identity Impersonation	888	1127
HasMember	B	613	Insufficient Session Expiration	888	1218
HasMember	B	645	Overly Restrictive Account Lockout Mechanism	888	1266

## Category-952: SFP Secondary Cluster: Missing Authentication

Category ID : 952

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Missing Authentication cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	V	306	Missing Authentication for Critical Function	888	673
HasMember	V	620	Unverified Password Change	888	1228

## Category-953: SFP Secondary Cluster: Missing Endpoint Authentication

Category ID : 953

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Missing Endpoint Authentication cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	V	422	Unprotected Windows Messaging Channel ('Shatter')	888	911
HasMember	B	425	Direct Request ('Forced Browsing')	888	914

## Category-954: SFP Secondary Cluster: Multiple Binds to the Same Port

Category ID : 954

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Multiple Binds to the Same Port cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	B	605	Multiple Binds to the Same Port	888	1205

## Category-955: SFP Secondary Cluster: Unrestricted Authentication

Category ID : 955

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Unrestricted Authentication cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	898	SFP Primary Cluster: Authentication	888	1808
HasMember	B	307	Improper Restriction of Excessive Authentication Attempts	888	677

**Category-956: SFP Secondary Cluster: Channel Attack**

Category ID : 956

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Channel Attack cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	902	SFP Primary Cluster: Channel	888	1809
HasMember	B	290	Authentication Bypass by Spoofing	888	640
HasMember	B	294	Authentication Bypass by Capture-replay	888	647
HasMember	G	300	Channel Accessible by Non-Endpoint ('Man-in-the-Middle')	888	662
HasMember	V	301	Reflection Attack in an Authentication Protocol	888	665
HasMember	B	419	Unprotected Primary Channel	888	907
HasMember	B	420	Unprotected Alternate Channel	888	908
HasMember	B	421	Race Condition During Access to Alternate Channel	888	910
HasMember	G	441	Unintended Proxy or Intermediary ('Confused Deputy')	888	949

**Category-957: SFP Secondary Cluster: Protocol Error**

Category ID : 957

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Protocol Error cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	902	SFP Primary Cluster: Channel	888	1809
HasMember	B	353	Missing Support for Integrity Check	888	780
HasMember	G	435	Improper Interaction Between Multiple Correctly-Behaving Entities	888	942
HasMember	B	436	Interpretation Conflict	888	943
HasMember	B	437	Incomplete Model of Endpoint Features	888	946
HasMember	G	757	Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade')	888	1392

**Category-958: SFP Secondary Cluster: Broken Cryptography**

Category ID : 958

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Broken Cryptography cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	903	SFP Primary Cluster: Cryptography	888	1809
HasMember	B	325	Missing Required Cryptographic Step	888	715
HasMember	B	327	Use of a Broken or Risky Cryptographic Algorithm	888	719

Nature	Type	ID	Name	V	Page
HasMember	B	328	Reversible One-Way Hash	888	725
HasMember	B	759	Use of a One-Way Hash without a Salt	888	1395
HasMember	B	760	Use of a One-Way Hash with a Predictable Salt	888	1400

## Category-959: SFP Secondary Cluster: Weak Cryptography

Category ID : 959

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Weak Cryptography cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	903	SFP Primary Cluster: Cryptography	888	1809
HasMember	V	261	Weak Cryptography for Passwords	888	578
HasMember	B	322	Key Exchange without Entity Authentication	888	710
HasMember	B	323	Reusing a Nonce, Key Pair in Encryption	888	712
HasMember	B	324	Use of a Key Past its Expiration Date	888	714
HasMember	G	326	Inadequate Encryption Strength	888	717
HasMember	V	329	Not Using a Random IV with CBC Mode	888	728
HasMember	B	347	Improper Verification of Cryptographic Signature	888	764
HasMember	B	640	Weak Password Recovery Mechanism for Forgotten Password	888	1252

## Category-960: SFP Secondary Cluster: Ambiguous Exception Type

Category ID : 960

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Ambiguous Exception Type cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1805
HasMember	B	396	Declaration of Catch for Generic Exception	888	858
HasMember	B	397	Declaration of Throws for Generic Exception	888	860

## Category-961: SFP Secondary Cluster: Incorrect Exception Behavior

Category ID : 961

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Incorrect Exception Behavior cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1805
HasMember	B	392	Missing Report of Error Condition	888	851
HasMember	B	393	Return of Wrong Status Code	888	853
HasMember	B	455	Non-exit on Failed Initialization	888	969
HasMember	V	460	Improper Cleanup on Thrown Exception	888	980
HasMember	B	544	Missing Standardized Error Handling Mechanism	888	1114
HasMember	B	584	Return Inside Finally Block	888	1170
HasMember	C	636	Not Failing Securely ('Failing Open')	888	1245
HasMember	C	703	Improper Check or Handling of Exceptional Conditions	888	1355

## Category-962: SFP Secondary Cluster: Unchecked Status Condition

Category ID : 962

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Unchecked Status Condition cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	889	SFP Primary Cluster: Exception Management	888	1805
HasMember	B	248	Uncaught Exception	888	548
HasMember	B	252	Unchecked Return Value	888	556
HasMember	B	253	Incorrect Check of Function Return Value	888	563
HasMember	B	273	Improper Check for Dropped Privileges	888	602
HasMember	B	280	Improper Handling of Insufficient Permissions or Privileges	888	613
HasMember	B	372	Incomplete Internal State Distinction	888	822
HasMember	C	390	Detection of Error Condition Without Action	888	844
HasMember	B	391	Unchecked Error Condition	888	849
HasMember	B	394	Unexpected Status Code or Return Value	888	855
HasMember	B	395	Use of NullPointerException Catch to Detect NULL Pointer Dereference	888	856
HasMember	B	431	Missing Handler	888	930
HasMember	V	478	Missing Default Case in Switch Statement	888	1016
HasMember	B	484	Omitted Break Statement in Switch	888	1031
HasMember	B	600	Uncaught Exception in Servlet	888	1193
HasMember	C	665	Improper Initialization	888	1293
HasMember	C	754	Improper Check for Unusual or Exceptional Conditions	888	1381
HasMember	C	755	Improper Handling of Exceptional Conditions	888	1389

## Category-963: SFP Secondary Cluster: Exposed Data

Category ID : 963

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Exposed Data cluster.

## Membership

Nature	Type	ID	Name	V	Page

## Category-964: SFP Secondary Cluster: Exposure Temporary File

Category ID : 964

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Exposure Temporary File cluster.

### Membership

1824

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1807
HasMember	B	377	Insecure Temporary File	888	828
HasMember	B	378	Creation of Temporary File With Insecure Permissions	888	831
HasMember	B	379	Creation of Temporary File in Directory with Incorrect Permissions	888	833

## Category-965: SFP Secondary Cluster: Insecure Session Management

Category ID : 965

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Insecure Session Management cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1807
HasMember	V	6	J2EE Misconfiguration: Insufficient Session-ID Length	888	2
HasMember	V	488	Exposure of Data Element to Wrong Session	888	1038
HasMember	V	524	Information Exposure Through Caching	888	1093

## Category-966: SFP Secondary Cluster: Other Exposures

Category ID : 966

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Other Exposures cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1807
HasMember	B	453	Insecure Default Variable Initialization	888	965
HasMember	V	487	Reliance on Package-level Scope	888	1036
HasMember	V	492	Use of Inner Class Containing Sensitive Data	888	1043
HasMember	V	525	Information Exposure Through Browser Caching	888	1094
HasMember	V	614	Sensitive Cookie in HTTPS Session Without 'Secure' Attribute	888	1219
HasMember	V	651	Information Exposure Through WSDL File	888	1276

## Category-967: SFP Secondary Cluster: State Disclosure

Category ID : 967

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the State Disclosure cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	895	SFP Primary Cluster: Information Leak	888	1807
HasMember	V	202	Exposure of Sensitive Data Through Data Queries	888	480
HasMember	G	203	Information Exposure Through Discrepancy	888	481
HasMember	B	204	Response Discrepancy Information Exposure	888	485
HasMember	B	205	Information Exposure Through Behavioral Discrepancy	888	488
HasMember	V	206	Information Exposure of Internal State Through Behavioral Inconsistency	888	489
HasMember	V	207	Information Exposure Through an External Behavioral Inconsistency	888	490
HasMember	B	208	Information Exposure Through Timing Discrepancy	888	491

### Category-968: SFP Secondary Cluster: Covert Channel

Category ID : 968

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Covert Channel cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	904	SFP Primary Cluster: Malware	888	1809
HasMember	B	385	Covert Timing Channel	888	841
HasMember	G	514	Covert Channel	888	1083
HasMember	B	515	Covert Storage Channel	888	1084

### Category-969: SFP Secondary Cluster: Faulty Memory Release

Category ID : 969

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Memory Release cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	891	SFP Primary Cluster: Memory Management	888	1805
HasMember	V	415	Double Free	888	900
HasMember	V	590	Free of Memory not on the Heap	888	1178
HasMember	V	761	Free of Pointer not at Start of Buffer	888	1402
HasMember	V	762	Mismatched Memory Management Routines	888	1406
HasMember	B	763	Release of Invalid Pointer or Reference	888	1409

### Category-970: SFP Secondary Cluster: Faulty Buffer Access

Category ID : 970

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Buffer Access cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1805
HasMember	G	118	Incorrect Access of Indexable Resource ('Range Error')	888	275
HasMember	G	119	Improper Restriction of Operations within the Bounds of a Memory Buffer	888	276
HasMember	B	120	Buffer Copy without Checking Size of Input ('Classic Buffer Overflow')	888	286
HasMember	V	121	Stack-based Buffer Overflow	888	295
HasMember	V	122	Heap-based Buffer Overflow	888	298
HasMember	B	123	Write-what-where Condition	888	302
HasMember	B	124	Buffer Underwrite ('Buffer Underflow')	888	304
HasMember	B	125	Out-of-bounds Read	888	308
HasMember	V	126	Buffer Over-read	888	310
HasMember	V	127	Buffer Under-read	888	313
HasMember	B	129	Improper Validation of Array Index	888	316

**Category-971: SFP Secondary Cluster: Faulty Pointer Use**

Category ID : 971

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Faulty Pointer Use cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1805
HasMember	B	469	Use of Pointer Subtraction to Determine Size	888	993
HasMember	B	476	NULL Pointer Dereference	888	1008
HasMember	V	588	Attempt to Access Child of a Non-structure Pointer	888	1176

**Category-972: SFP Secondary Cluster: Faulty String Expansion**

Category ID : 972

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Faulty String Expansion cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1805
HasMember	V	785	Use of Path Manipulation Function without Maximum-sized Buffer	888	1460

**Category-973: SFP Secondary Cluster: Improper NULL Termination**

Category ID : 973

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Improper NULL Termination cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1805
HasMember	B	170	Improper Null Termination	888	403

## Category-974: SFP Secondary Cluster: Incorrect Buffer Length Computation

Category ID : 974

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Incorrect Buffer Length Computation cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	890	SFP Primary Cluster: Memory Access	888	1805
HasMember	B	131	Incorrect Calculation of Buffer Size	888	330
HasMember	B	135	Incorrect Calculation of Multi-Byte String Length	888	344
HasMember	V	467	Use of sizeof() on a Pointer Type	888	989

## Category-975: SFP Secondary Cluster: Architecture

Category ID : 975

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Architecture cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	907	SFP Primary Cluster: Other	888	1811
HasMember	B	348	Use of Less Trusted Source	888	766
HasMember	C	359	Exposure of Private Information ('Privacy Violation')	888	788
HasMember	B	602	Client-Side Enforcement of Server-Side Security	888	1200
HasMember	C	637	Unnecessary Complexity in Protection Mechanism (Not Using 'Economy of Mechanism')	888	1247
HasMember	B	649	Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking	888	1273
HasMember	B	654	Reliance on a Single Factor in a Security Decision	888	1281
HasMember	B	656	Reliance on Security Through Obscurity	888	1285
HasMember	C	657	Violation of Secure Design Principles	888	1287
HasMember	C	671	Lack of Administrator Control over Security	888	1309
HasMember	C	693	Protection Mechanism Failure	888	1344
HasMember	B	749	Exposed Dangerous Method or Function	888	1377

## Category-976: SFP Secondary Cluster: Compiler

Category ID : 976

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Compiler cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	907	SFP Primary Cluster: Other	888	1811
HasMember	B	733	Compiler Optimization Removal or Modification of Security-critical Code	888	1376

## Category-977: SFP Secondary Cluster: Design

Category ID : 977

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Design cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	907	SFP Primary Cluster: Other	888	1811
HasMember	B	115	Misinterpretation of Input	888	264
HasMember	V	187	Partial String Comparison	888	440
HasMember	B	188	Reliance on Data/Memory Layout	888	443
HasMember	B	193	Off-by-one Error	888	457
HasMember	B	349	Acceptance of Extraneous Untrusted Data With Trusted Data	888	768
HasMember	G	405	Asymmetric Resource Consumption (Amplification)	888	881
HasMember	B	406	Insufficient Control of Network Message Volume (Network Amplification)	888	883
HasMember	B	407	Algorithmic Complexity	888	885
HasMember	B	408	Incorrect Behavior Order: Early Amplification	888	887
HasMember	B	409	Improper Handling of Highly Compressed Data (Data Amplification)	888	889
HasMember	B	410	Insufficient Resource Pool	888	891
HasMember	B	430	Deployment of Wrong Handler	888	929
HasMember	B	462	Duplicate Key in Associative List (Alist)	888	982
HasMember	B	463	Deletion of Data Structure Sentinel	888	984
HasMember	B	464	Addition of Data Structure Sentinel	888	986
HasMember	B	480	Use of Incorrect Operator	888	1021
HasMember	V	483	Incorrect Block Delimitation	888	1029
HasMember	B	581	Object Model Violation: Just One of Equals and Hashcode Defined	888	1165
HasMember	V	595	Comparison of Object References Instead of Object Contents	888	1186
HasMember	B	618	Exposed Unsafe ActiveX Method	888	1225
HasMember	B	648	Incorrect Use of Privileged APIs	888	1271
HasMember	G	670	Always-Incorrect Control Flow Implementation	888	1308
HasMember	G	682	Incorrect Calculation	888	1325

Nature	Type	ID	Name	V	Page
HasMember		691	Insufficient Control Flow Management	888	1342
HasMember		696	Incorrect Behavior Order	888	1349
HasMember		697	Incorrect Comparison	888	1350
HasMember		698	Execution After Redirect (EAR)	888	1354
HasMember		705	Incorrect Control Flow Scoping	888	1359

## Category-978: SFP Secondary Cluster: Implementation

Category ID : 978

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Implementation cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf		907	SFP Primary Cluster: Other	888	1811
HasMember		216	Containment Errors (Container Errors)	888	511
HasMember		358	Improperly Implemented Security Check for Standard	888	786
HasMember		398	7PK - Code Quality	888	1744
HasMember		623	Unsafe ActiveX Control Marked Safe For Scripting	888	1233
HasMember		710	Improper Adherence to Coding Standards	888	1366

## Category-979: SFP Secondary Cluster: Failed Chroot Jail

Category ID : 979

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Failed Chroot Jail cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf		893	SFP Primary Cluster: Path Resolution	888	1806
HasMember		243	Creation of chroot Jail Without Changing Working Directory	888	542

## Category-980: SFP Secondary Cluster: Link in Resource Name Resolution

Category ID : 980

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Link in Resource Name Resolution cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf		893	SFP Primary Cluster: Path Resolution	888	1806

Nature	Type	ID	Name	V	Page
HasMember	B	59	Improper Link Resolution Before File Access ('Link Following')	888	108
HasMember	V	62	UNIX Hard Link	888	115
HasMember	V	64	Windows Shortcut Following (.LNK)	888	117
HasMember	V	65	Windows Hard Link	888	119
HasMember	B	386	Symbolic Name not Mapping to Correct Object	888	843
HasMember	G	610	Externally Controlled Reference to a Resource in Another Sphere	888	1212

## Category-981: SFP Secondary Cluster: Path Traversal

Category ID : 981

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Path Traversal cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	893	SFP Primary Cluster: Path Resolution	888	1806
HasMember	G	22	Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	888	30
HasMember	B	23	Relative Path Traversal	888	41
HasMember	V	24	Path Traversal: './filedir'	888	47
HasMember	V	25	Path Traversal: '/../filedir'	888	49
HasMember	V	26	Path Traversal: '/dir../filename'	888	51
HasMember	V	27	Path Traversal: 'dir../filename'	888	52
HasMember	V	28	Path Traversal: '..filedir'	888	54
HasMember	V	29	Path Traversal: '..filename'	888	56
HasMember	V	30	Path Traversal: 'dir..filename'	888	58
HasMember	V	31	Path Traversal: 'dir..\..filename'	888	60
HasMember	V	32	Path Traversal: '...' (Triple Dot)	888	62
HasMember	V	33	Path Traversal: '....' (Multiple Dot)	888	64
HasMember	V	34	Path Traversal: '....//'	888	66
HasMember	V	35	Path Traversal: '...//..//'	888	68

HasMember	V	40	Path Traversal: '\\UNC\share\name' (Windows UNC Share)	888	80
HasMember	B	41	Improper Resolution of Path Equivalence	888	82
HasMember	V	42	Path Equivalence: 'filename.' (Trailing Dot)	888	88
HasMember	V	43	Path Equivalence: 'filename....' (Multiple Trailing Dot)	888	89
HasMember	V	44	Path Equivalence: 'file.name' (Internal Dot)	888	90
HasMember	V	45	Path Equivalence: 'file...name' (Multiple Internal Dot)	888	91
HasMember	V	46	Path Equivalence: 'filename ' (Trailing Space)	888	92
HasMember	V	47	Path Equivalence: ' filename' (Leading Space)	888	93
HasMember	V	48	Path Equivalence: 'file name' (Internal Whitespace)	888	94
HasMember	V	49	Path Equivalence: 'filename/' (Trailing Slash)	888	95

Nature	Type	ID	Name	V	Page
HasMember	V	50	Path Equivalence: '//multiple/leading/slash'	888	96
HasMember	V	51	Path Equivalence: '/multiple//internal/slash'	888	98
HasMember	V	52	Path Equivalence: '/multiple/trailing/slash/'	888	99
HasMember	V	53	Path Equivalence: '\multiple\internal\backslash'	888	100
HasMember	V	54	Path Equivalence: 'filedir\' (Trailing Backslash)	888	101
HasMember	V	55	Path Equivalence: './' (Single Dot Directory)	888	102
HasMember	V	56	Path Equivalence: 'filedir*' (Wildcard)	888	104
HasMember	V	57	Path Equivalence: 'fakedir../readdir/filename'	888	105
HasMember	V	58	Path Equivalence: Windows 8.3 Filename	888	106
HasMember	B	66	Improper Handling of File Names that Identify Virtual Resources	888	120
HasMember	V	67	Improper Handling of Windows Device Names	888	122
HasMember	V	72	Improper Handling of Apple HFS+ Alternate Data Stream Path	888	127
HasMember	G	73	External Control of File Name or Path	888	128
HasMember	B	428	Unquoted Search Path or Element	888	926
HasMember	G	706	Use of Incorrectly-Resolved Name or Reference	888	1361

## Category-982: SFP Secondary Cluster: Failure to Release Resource

Category ID : 982

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Failure to Release Resource cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	892	SFP Primary Cluster: Resource Management	888	1806
HasMember	V	401	Improper Release of Memory Before Removing Last Reference	888	870
HasMember	G	404	Improper Resource Shutdown or Release	888	876
HasMember	B	459	Incomplete Cleanup	888	978
HasMember	B	771	Missing Reference to Active Allocated Resource	888	1430
HasMember	B	772	Missing Release of Resource after Effective Lifetime	888	1432
HasMember	V	773	Missing Reference to Active File Descriptor or Handle	888	1437
HasMember	V	775	Missing Release of File Descriptor or Handle after Effective Lifetime	888	1439

## Category-983: SFP Secondary Cluster: Faulty Resource Use

Category ID : 983

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Faulty Resource Use cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	892	SFP Primary Cluster: Resource Management	888	1806
HasMember	B	416	Use After Free	888	903
HasMember	B	672	Operation on a Resource after Expiration or Release	888	1310

### Category-984: SFP Secondary Cluster: Life Cycle

Category ID : 984 Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Life Cycle cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	892	SFP Primary Cluster: Resource Management	888	1806
HasMember	G	664	Improper Control of a Resource Through its Lifetime	888	1291
HasMember	B	666	Operation on Resource in Wrong Phase of Lifetime	888	1298
HasMember	G	675	Duplicate Operations on Resource	888	1316
HasMember	B	694	Use of Multiple Resources with Duplicate Identifier	888	1346

### Category-985: SFP Secondary Cluster: Unrestricted Consumption

Category ID : 985 Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Unrestricted Consumption cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	892	SFP Primary Cluster: Resource Management	888	1806
HasMember	G	400	Uncontrolled Resource Consumption	888	862
HasMember	B	674	Uncontrolled Recursion	888	1314
HasMember	B	770	Allocation of Resources Without Limits or Throttling	888	1423
HasMember	V	774	Allocation of File Descriptors or Handles Without Limits or Throttling	888	1438

### Category-986: SFP Secondary Cluster: Missing Lock

Category ID : 986 Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Missing Lock cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	894	SFP Primary Cluster: Synchronization	888	1806
HasMember	B	364	Signal Handler Race Condition	888	802

Nature	Type	ID	Name	V	Page
HasMember	B	365	Race Condition in Switch	888	807
HasMember	B	366	Race Condition within a Thread	888	809
HasMember	B	368	Context Switching Race Condition	888	815
HasMember	B	413	Improper Resource Locking	888	895
HasMember	B	414	Missing Lock Check	888	899
HasMember	V	543	Use of Singleton Pattern Without Synchronization in a Multithreaded Context	888	1113
HasMember	B	567	Unsynchronized Access to Shared Data in a Multithreaded Context	888	1142
HasMember	B	609	Double-Checked Locking	888	1210

HasMember	B	663	Use of a Non-reentrant Function in a Concurrent Context	888	1290
HasMember	B	667	Improper Locking	888	1300

### Category-987: SFP Secondary Cluster: Multiple Locks/Unlocks

Category ID : 987

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Multiple Locks/Unlocks cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	894	SFP Primary Cluster: Synchronization	888	1806
HasMember	V	585	Empty Synchronized Block	888	1171
HasMember	V	764	Multiple Locks of a Critical Resource	888	1413
HasMember	V	765	Multiple Unlocks of a Critical Resource	888	1415

### Category-988: SFP Secondary Cluster: Race Condition Window

Category ID : 988

Status: Incomplete

#### Summary

This category identifies Software Fault Patterns (SFPs) within the Race Condition Window cluster.

#### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	894	SFP Primary Cluster: Synchronization	888	1806
HasMember	G	362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	888	793
HasMember	B	363	Race Condition Enabling Link Following	888	800
HasMember	B	367	Time-of-check Time-of-use (TOCTOU) Race Condition	888	811
HasMember	V	370	Missing Check for Certificate Revocation after Initial Check	888	820
HasMember	G	638	Not Using Complete Mediation	888	1248

**Category-989: SFP Secondary Cluster: Unrestricted Lock**

Category ID : 989

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Unrestricted Lock cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	894	SFP Primary Cluster: Synchronization	888	1806
HasMember	B	412	Unrestricted Externally Accessible Lock	888	893

**Category-990: SFP Secondary Cluster: Tainted Input to Command**

Category ID : 990

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Tainted Input to Command cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1807
HasMember	G	74	Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection')	888	133
HasMember	G	75	Failure to Sanitize Special Elements into a Different Plane (Special Element Injection)	888	137
HasMember	B	76	Improper Neutralization of Equivalent Special Elements	888	138
HasMember	G	77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	888	140
HasMember	B	78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	888	145
HasMember	B	79	Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')	888	156
HasMember	V	80	Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS)	888	169

HasMember	V	644	Improper Neutralization of HTTP Headers for Scripting Syntax	888	1265
HasMember	V	646	Reliance on File Name or Extension of Externally-Supplied File	888	1268
HasMember	B	652	Improper Neutralization of Data within XQuery Expressions ('XQuery Injection')	888	1277
HasMember	G	707	Improper Enforcement of Message or Data Structure	888	1362

## Category-991: SFP Secondary Cluster: Tainted Input to Environment

Category ID : 991

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Tainted Input to Environment cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1807
HasMember	G	94	Improper Control of Generation of Code ('Code Injection')	888	209
HasMember	B	114	Process Control	888	261
HasMember	B	427	Uncontrolled Search Path Element	888	922
HasMember	B	470	Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection')	888	995
HasMember	B	471	Modification of Assumed-Immutable Data (MAID)	888	998
HasMember	B	472	External Control of Assumed-Immutable Web Parameter	888	1000
HasMember	V	473	PHP External Variable Modification	888	1004
HasMember	B	494	Download of Code Without Integrity Check	888	1052
HasMember	V	622	Improper Validation of Function Hook Arguments	888	1232
HasMember	G	673	External Influence of Sphere Definition	888	1313

**Category-992: SFP Secondary Cluster: Faulty Input Transformation**

Category ID : 992

Status: Incomplete

**Summary**

This category identifies Software Fault Patterns (SFPs) within the Faulty Input Transformation cluster.

**Membership**

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1807
HasMember	G	116	Improper Encoding or Escaping of Output	888	265
HasMember	B	166	Improper Handling of Missing Special Element	888	398
HasMember	B	167	Improper Handling of Additional Special Element	888	400
HasMember	B	168	Improper Handling of Inconsistent Special Elements	888	402
HasMember	G	172	Encoding Error	888	407
HasMember	V	173	Improper Handling of Alternate Encoding	888	410
HasMember	V	174	Double Decoding of the Same Data	888	411
HasMember	V	175	Improper Handling of Mixed Encoding	888	413
HasMember	V	176	Improper Handling of Unicode Encoding	888	415
HasMember	V	177	Improper Handling of URL Encoding (Hex Encoding)	888	417
HasMember	B	178	Improper Handling of Case Sensitivity	888	420
HasMember	B	179	Incorrect Behavior Order: Early Validation	888	423
HasMember	B	180	Incorrect Behavior Order: Validate Before Canonicalize	888	426
HasMember	B	181	Incorrect Behavior Order: Validate Before Filter	888	428
HasMember	B	182	Collapse of Data into Unsafe Value	888	430

**Category-993: SFP Secondary Cluster: Incorrect Input Handling**

Category ID : 993

Status: Incomplete

**Summary**

1838

This category identifies Software Fault Patterns (SFPs) within the Incorrect Input Handling cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1807

HasMember	V	239	Failure to Handle Incomplete Element	888	536
HasMember	B	240	Improper Handling of Inconsistent Structural Elements	888	537
HasMember	B	241	Improper Handling of Unexpected Data Type	888	538
HasMember	B	351	Insufficient Type Distinction	888	772
HasMember	B	354	Improper Validation of Integrity Check Value	888	782

## Category-994: SFP Secondary Cluster: Tainted Input to Variable

Category ID : 994

Status: Incomplete

### Summary

This category identifies Software Fault Patterns (SFPs) within the Tainted Input to Variable cluster.

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	896	SFP Primary Cluster: Tainted Input	888	1807
HasMember	B	15	External Control of System or Configuration Setting	888	16
HasMember	G	20	Improper Input Validation	888	18
HasMember	B	454	External Initialization of Trusted Variables or Data Stores	888	967
HasMember	V	496	Public Data Assigned to Private Array-Typed Field	888	1058
HasMember	V	502	Deserialization of Untrusted Data	888	1069
HasMember	V	566	Authorization Bypass Through User-Controlled SQL Primary Key	888	1140
HasMember	B	606	Unchecked Input for Loop Condition	888	1206
HasMember	V	616	Incomplete Identification of Uploaded File Variables (PHP)	888	1222

## Category-995: SFP Secondary Cluster: Feature

Category ID : 995

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Feature cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	906	SFP Primary Cluster: UI	888	1810
HasMember	B	447	Unimplemented or Unsupported Feature in UI	888	957
HasMember	B	448	Obsolete Feature in UI	888	958
HasMember	B	449	The UI Performs the Wrong Action	888	959
HasMember	B	450	Multiple Interpretations of UI Input	888	960
HasMember	C	451	User Interface (UI) Misrepresentation of Critical Information	888	961
HasMember	V	549	Missing Password Field Masking	888	1120
HasMember	B	655	Insufficient Psychological Acceptability	888	1283

## Category-996: SFP Secondary Cluster: Security

Category ID : 996

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Security cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	906	SFP Primary Cluster: UI	888	1810
HasMember	B	356	Product UI does not Warn User of Unsafe Actions	888	784
HasMember	B	357	Insufficient UI Warning of Dangerous Operations	888	785
HasMember	B	446	UI Discrepancy for Security Feature	888	956

## Category-997: SFP Secondary Cluster: Information Loss

Category ID : 997

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Information Loss cluster.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	C	906	SFP Primary Cluster: UI	888	1810
HasMember	C	221	Information Loss or Omission	888	515
HasMember	B	222	Truncation of Security-relevant Information	888	516
HasMember	B	223	Omission of Security-relevant Information	888	517
HasMember	B	224	Obscured Security-relevant Information by Alternate Name	888	518

## Category-998: SFP Secondary Cluster: Glitch in Computation

Category ID : 998

Status: Incomplete

## Summary

This category identifies Software Fault Patterns (SFPs) within the Glitch in Computation cluster.

## Membership

HasMember	V	608	Struts: Non-private Field in ActionForm Class	888	1209
HasMember	V	766	Critical Data Element Declared Public	888	1416

## Category-1005: 7PK - Input Validation and Representation

Category ID : 1005

Status: Draft

### Summary

This category represents one of the phyla in the Seven Pernicious Kingdoms vulnerability classification. It includes weaknesses that exist when an application does not properly validate or represent input. According to the authors of the Seven Pernicious Kingdoms, "Input validation and representation problems are caused by metacharacters, alternate encodings and numeric representations. Security problems result from trusting input."

### Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	700	Seven Pernicious Kingdoms	700	1891
HasMember	G	20	Improper Input Validation	700	18
HasMember	G	77	Improper Neutralization of Special Elements used in a Command ('Command Injection')	700	140
HasMember	B	79	Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting')	700	156
HasMember	B	89	Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	700	191
HasMember	B	99	Improper Control of Resource Identifiers ('Resource Injection')	700	230

## Category-1006: Bad Coding Practices

Category ID : 1006

Status: Draft

### Summary

Weaknesses in this category are related to coding practices that are deemed unsafe and increase the chances that an exploitable vulnerability will be present in the application. These weaknesses do not directly introduce a vulnerability, but indicate that the product has not been carefully developed or maintained. If a program is complex, difficult to maintain, not portable, or shows evidence of neglect, then there is a higher likelihood that weaknesses are buried in the code.

## Category-1009: Audit

Category ID : 1009

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of audit-based components of the system. Frequently these deal with logging user activities in order to identify attackers and modifications to the system. The weaknesses in this category could lead to a degradation of the

quality of the audit capability if they are not addressed when designing or implementing a secure architecture.

## Category-1010: Authenticate Actors

Category ID : 1010

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of authentication components of the system. Frequently these deal with verifying the entity is indeed who it claims to be. The weaknesses in this category could lead to a degradation of the quality of authentication if they are not addressed when designing or implementing a secure architecture.

## Category-1011: Authorize Actors

Category ID : 1011

Status: Draft

## Summary

Weaknesses in this category are related to the design and architecture of a system's authorization components. Frequently these deal with enforcing that agents have the required permissions before performing certain operations, such as modifying data. The weaknesses in this category could lead to a degradation of quality of the authorization capability if they are not addressed when designing or implementing a secure architecture.

## Category-1012: Cross Cutting

Category ID : 1012

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of multiple security tactics and how they affect a system. For example, information exposure can impact the Limit Access and Limit Exposure security tactics. The weaknesses in this category could lead to a degradation of the quality of many capabilities if they are not addressed when designing or implementing a secure architecture.

## Category-1013: Encrypt Data

Category ID : 1013

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of data confidentiality in a system. Frequently these deal with the use of encryption libraries. The weaknesses in this category could lead to a degradation of the quality data encryption if they are not addressed when designing or implementing a secure architecture.

## Category-1015: Limit Access

Category ID : 1015

Status: Draft

## Summary

Weaknesses in this category are related to the design and architecture of system resources. Frequently these deal with restricting the amount of resources that are accessed by actors, such as memory, network connections, CPU or access points. The weaknesses in this category could lead to a degradation of the quality of authentication if they are not addressed when designing or implementing a secure architecture.

## Category-1016: Limit Exposure

Category ID : 1016

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of the entry points to a system. Frequently these deal with minimizing the attack surface through designing the system with the least needed amount of entry points. The weaknesses in this category could lead to a degradation of a system's defenses if they are not addressed when designing or implementing a secure architecture.

## Category-1017: Lock Computer

Category ID : 1017

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of a system's lockout mechanism. Frequently these deal with scenarios that take effect in case of multiple failed attempts to access a given resource. The weaknesses in this category could lead to a degradation of access to system assets if they are not addressed when designing or implementing a secure architecture.

## Category-1018: Manage User Sessions

Category ID : 1018

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of session management. Frequently these deal with the information or status about each user and their access rights for the duration of multiple requests. The weaknesses in this category could lead to a degradation of the quality of session management if they are not addressed when designing or implementing a secure architecture.

## Category-1019: Validate Inputs

Category ID : 1019

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of a system's input validation components. Frequently these deal with sanitizing, neutralizing and validating any externally provided inputs to minimize malformed data from entering the system and preventing code injection in the input data. The weaknesses in this category could lead to a degradation of the quality of data flow in a system if they are not addressed when designing or implementing a secure architecture.

## Category-1020: Verify Message Integrity

Category ID : 1020

Status: Draft

### Summary

Weaknesses in this category are related to the design and architecture of a system's data integrity components. Frequently these deal with ensuring integrity of data, such as messages, resource files, deployment files, and configuration files. The weaknesses in this category could lead to a degradation of data integrity quality if they are not addressed when designing or implementing a secure architecture.

[REF-957]"Top 10 2017". 2017 April 2. OWASP. < [https://www.owasp.org/images/7/72/OWASP\\_Top\\_10-2017\\_%28en%29.pdf](https://www.owasp.org/images/7/72/OWASP_Top_10-2017_%28en%29.pdf) >.

## Category-1035: OWASP Top Ten 2017 Category A9 - Using Components with Known Vulnerabilities

Category ID : 1035

Status: Incomplete

### Summary

Weaknesses in this category are related to the A9 category in the OWASP Top Ten 2017.

## Membership

Nature	Type	ID	Name	V	Page
MemberOf	V	1026	Weaknesses in OWASP Top Ten (2017)	1026	1912

## Notes

### Relationship

This is an unusual category. CWE does not cover the limitations of human processes and procedures that cannot be described in terms of a specific technical weakness as resident in the code, architecture, or configuration of the software. Since "known vulnerabilities" can arise from any kind of weakness, it is not possible to map this OWASP category to other CWE entries, since it would effectively require mapping this category to ALL weaknesses.

## References

### View-629: Weaknesses in OWASP Top Ten (2007)

View ID : 629

Status: Obsolete

Type : Graph

### Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2007. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

## Audience

### Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2007 version), providing a good starting point for web application developers who want to code more securely.

### Software Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2007 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

### Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

## Membership

**View-635: Weaknesses Originally Used by NVD from 2008 to 2016**

View ID : 635

Status: Draft

Type : Explicit

**Objective**

CWE nodes in this view (slice) were used by NIST to categorize vulnerabilities within NVD, from 2008 to 2016. This original version has been used by many other projects.

**Membership**

Nature	Type	ID	Name	Page
HasMember		16	Configuration	1727
HasMember		20	Improper Input Validation	18
HasMember		22	Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal')	30
HasMember		59	Improper Link Resolution Before File Access ('Link Following')	108
HasMember		78	Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection')	145

HasMember		264	Permissions, Privileges, and Access Controls	1735
HasMember		287	Improper Authentication	630
HasMember		310	Cryptographic Issues	1738
HasMember		352	Cross-Site Request Forgery (CSRF)	773
HasMember		362	Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition')	793
HasMember		399	Resource Management Errors	1745

**Notes****Maintenance**

This view is effectively obsolete, although it is probably still in active use by CWE consumers. In Summer 2007, NIST began using this set of CWE elements to classify CVE entries within the National Vulnerability Database (NVD). The data was made publicly available beginning in 2008. In 2016, NIST began using a different list as derived from the "Weaknesses for Simplified Mapping of Published Vulnerabilities" view (CWE-1003).

## View-699: Development Concepts

View ID : 699	Status: Incomplete
Type : Graph	

### Objective

This view organizes weaknesses around concepts that are frequently used or encountered in software development. Accordingly, this view can align closely with the perspectives of developers, educators, and assessment vendors. It provides a variety of categories that are intended to simplify navigation, browsing, and mapping.

### Audience

#### Software Developers

Software developers use this view to better understand potential mistakes that can be made in specific areas of their code. The use of concepts that developers are familiar with makes it easier to navigate.

#### Educators

Educators use this view to teach future developers about the types of mistakes that are commonly made within specific parts of a codebase.

## View-700: Seven Pernicious Kingdoms

<b>View ID</b> : 700	<b>Status</b> : Incomplete
<b>Type</b> : Graph	

### Objective

This view (graph) organizes weaknesses using a hierarchical structure that is similar to that used by Seven Pernicious Kingdoms.

### Audience

#### Software Developers

This view is useful for developers because it is organized around concepts with which developers are familiar, and it focuses on weaknesses that can be detected using source code analysis tools.

### Membership

## View-711: Weaknesses in OWASP Top Ten (2004)

<b>View ID :</b> 711	<b>Status:</b> Obsolete
<b>Type :</b> Graph	

### Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2004, and as required for compliance with PCI DSS version 1.1. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

### Audience

#### Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2004 version), providing a good starting point for web application developers who want to code more securely, as well as complying with PCI DSS 1.1.

#### Software Customers

This view outlines the most important issues as identified by the OWASP Top Ten, providing customers with a way of asking their software developers to follow minimum expectations for secure code, in compliance with PCI-DSS 1.1.

#### Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students. However, the 2007 version (CWE-629) might be more appropriate.

### Membership

Nature	Type	ID	Name	Page
HasMember	C	722	OWASP Top Ten 2004 Category A1 - Unvalidated Input	1757
HasMember	C	723	OWASP Top Ten 2004 Category A2 - Broken Access Control	1758
HasMember	C	724	OWASP Top Ten 2004 Category A3 - Broken Authentication and Session Management	1759
HasMember	C	725	OWASP Top Ten 2004 Category A4 - Cross-Site Scripting (XSS) Flaws	1759
HasMember	C	726	OWASP Top Ten 2004 Category A5 - Buffer Overflows	1760
HasMember	C	727	OWASP Top Ten 2004 Category A6 - Injection Flaws	1760
HasMember	C	728	OWASP Top Ten 2004 Category A7 - Improper Error Handling	1761
HasMember	C	729	OWASP Top Ten 2004 Category A8 - Insecure Storage	1761
HasMember	C	730	OWASP Top Ten 2004 Category A9 - Denial of Service	1762
HasMember	C	731	OWASP Top Ten 2004 Category A10 - Insecure Configuration Management	1762

### Notes

#### Relationship

CWE relationships for this view were obtained by examining the OWASP document and mapping to any items that were specifically mentioned within the text of a category. As a result, this mapping is not complete with respect to all of CWE. In addition, some concepts were mentioned in multiple Top Ten items, which caused them to be mapped to multiple CWE categories. For example, SQL injection is mentioned in both A1 (CWE-722) and A6 (CWE-727) categories.

#### Maintenance

Some parts of CWE are not fully fleshed out in terms of weaknesses. When these areas were mentioned in the Top Ten, category nodes were mapped, although general mapping practice would usually favor mapping only to weaknesses.

## View-734: Weaknesses Addressed by the CERT C Secure Coding Standard (2008)

View ID : 734

Status: Obsolete

Type : Graph

## Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the book "The CERT C Secure Coding Standard" published in 2008. This view is considered obsolete as a newer version of the coding standard is available.

## Audience

### Software Developers

By following the CERT C Secure Coding Standard, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

### Software Customers

If a software developer claims to be following the CERT C Secure Coding standard, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

## Membership

HasMember		745	CERT C Secure Coding Standard (2008) Chapter 12 - Signals (SIG)	1772
HasMember		746	CERT C Secure Coding Standard (2008) Chapter 13 - Error Handling (ERR)	1772
HasMember		747	CERT C Secure Coding Standard (2008) Chapter 14 - Miscellaneous (MSC)	1773
HasMember		748	CERT C Secure Coding Standard (2008) Appendix - POSIX (POS)	1774

## Notes

## Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

## Maintenance

This view is no longer being actively maintained, since it statically represents the coding rules as they were in 2008.

## View-750: Weaknesses in the 2009 CWE/SANS Top 25 Most Dangerous Programming Errors

View ID : 750

Status: Obsolete

Type : Graph

## Objective

CWE entries in this view (graph) are listed in the 2009 CWE/SANS Top 25 Programming Errors. This view is considered obsolete as a newer version of the Top 25 is available.

## Audience

### Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

### Software Customers

If a software developer claims to be following the Top 25, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

## View-800: Weaknesses in the 2010 CWE/SANS Top 25 Most Dangerous Programming Errors

View ID : 800

Status: Obsolete

Type : Graph

### Objective

CWE entries in this view (graph) are listed in the 2010 CWE/SANS Top 25 Programming Errors. This view is considered obsolete as a newer version of the Top 25 is available.

### Audience

#### Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

#### Software Customers

If a software developer claims to be following the Top 25, then customers can use the weaknesses in this view in order to formulate independent evidence of that claim.

#### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

## View-809: Weaknesses in OWASP Top Ten (2010)

View ID : 809

Status: Obsolete

Type : Graph

### Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2010. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

## Audience

### Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2010 version), providing a good starting point for web application developers who want to code more securely.

### Software Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2010 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

### Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

## Membership

Nature	Type	ID	Name	Page

HasMember	C	818	OWASP Top Ten 2010 Category A9 - Insufficient Transport Layer Protection	1782
HasMember	C	819	OWASP Top Ten 2010 Category A10 - Unvalidated Redirects and Forwards	1783

## Notes

### Relationship

The relationships in this view are a direct extraction of the CWE mappings that are in the 2010 OWASP document. CWE has changed since the release of that document.

## View-844: Weaknesses Addressed by The CERT Oracle Secure Coding Standard for Java (2011)

View ID : 844

Status: Obsolete

Type : Graph

### Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the book "The CERT Oracle Secure Coding Standard for Java" published in 2011. This view is considered obsolete as a newer version of the coding standard is available.

### Audience

#### Software Developers

By following The CERT Oracle Secure Coding Standard for Java, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

#### Software Customers

If a software developer claims to be following The CERT Oracle Secure Coding Standard for Java, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

#### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

HasMember	C	861	The CERT Oracle Secure Coding Standard for Java (2011) Chapter 18 - Miscellaneous (MSC)	1793

## Notes

### Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

## View-868: Weaknesses Addressed by the SEI CERT C++ Coding Standard (2016 Version)

View ID : 868

Status: Obsolete

Type : Graph

## Objective

CWE entries in this view (graph) are fully or partially eliminated by following the SEI CERT C++ Coding Standard, as published in 2016.

## Audience

### Software Developers

By following the CERT C++ Secure Coding Standard, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

### Software Customers

If a software developer claims to be following the CERT C++ Secure Coding Standard, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

HasMember	<b>C</b>	883	CERT C++ Secure Coding Section 49 - Miscellaneous (MSC)	1803

### Notes

#### Relationship

The relationships in this view were determined based on specific statements within the rules from the standard. Not all rules have direct relationships to individual weaknesses, although they likely have chaining relationships in specific circumstances.

#### Maintenance

This view is no longer being actively maintained, since it statically represents the coding rules as they were in 2016.

## View-884: CWE Cross-section

View ID : 884  
Type : Explicit

Status: Incomplete

### Objective

This view contains a selection of weaknesses that represent the variety of weaknesses that are captured in CWE, at a level of abstraction that is likely to be useful to most audiences. It can be used by researchers to determine how broad their theories, models, or tools are. It will also be used by the CWE content team in 2012 to focus quality improvement efforts for individual CWE entries.

## View-900: Weaknesses in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors

View ID : 900

Status: Incomplete

Type : Graph

### Objective

1906

CWE entries in this view (graph) are listed in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors.

### Audience

#### Software Developers

By following the Top 25, developers will be able to significantly reduce the number of weaknesses that occur in their software.

#### Software Customers

If a software developer claims to be following the Top 25, then customers can use the weaknesses in this view in order to formulate independent evidence of that claim.

#### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could focus on the Top 25.

### Membership

## View-928: Weaknesses in OWASP Top Ten (2013)

View ID : 928

Status: Obsolete

Type : Graph

### Objective

CWE nodes in this view (graph) are associated with the OWASP Top Ten, as released in 2013. This view is considered obsolete as a newer version of the OWASP Top Ten is available.

### Audience

#### Software Developers

This view outlines the most important issues as identified by the OWASP Top Ten (2013 version), providing a good starting point for web application developers who want to code more securely.

#### Software Customers

This view outlines the most important issues as identified by the OWASP Top Ten (2013 version), providing customers with a way of asking their software developers to follow minimum expectations for secure code.

#### Educators

Since the OWASP Top Ten covers the most frequently encountered issues, this view can be used by educators as training material for students.

### Membership

Nature	Type	ID	Name	Page

## View-999: Weaknesses without Software Fault Patterns

**View ID :** 999

**Status:** Incomplete

**Type :** Implicit

### Objective

CWE identifiers in this view are weaknesses that do not have associated Software Fault Patterns (SFPs), as covered by the CWE-888 view. As such, they represent gaps in coverage by the current software fault pattern model.

### Audience

**Applied Researchers**

**Academic Researchers**

**Software Vendors**

### Filter

## View-1000: Research Concepts

**View ID :** 1000

**Status:** Draft

**Type :** Graph

### Objective

This view is intended to facilitate research into weaknesses, including their inter-dependencies, and can be leveraged to systematically identify theoretical gaps within CWE. It classifies weaknesses in a way that largely ignores how they can be detected, where they appear in code, and when they

are introduced in the software development life cycle. Instead, it is mainly organized according to abstractions of software behaviors.

## Audience

### Academic Researchers

Academic researchers can use the high-level classes that lack a significant number of children to identify potential areas for future research.

### Vulnerability Analysts

Those who perform vulnerability discovery/analysis use this view to identify related weaknesses that might be leveraged by following relationships between higher-level classes and bases.

### Assessment Vendors

Assessment vendors often use this view to help identify additional weaknesses that a tool may be able to detect as the relationships are more aligned with a tool's technical capabilities.

## Membership

Nature	Type	ID	Name	Page
HasMember	🟢	118	Incorrect Access of Indexable Resource ('Range Error')	275
HasMember	🟢	330	Use of Insufficiently Random Values	729
HasMember	🟢	435	Improper Interaction Between Multiple Correctly-Behaving Entities	942
HasMember	🟢	664	Improper Control of a Resource Through its Lifetime	1291

HasMember	🟢	703	Improper Check or Handling of Exceptional Conditions	1355
HasMember	🟢	707	Improper Enforcement of Message or Data Structure	1362
HasMember	🟢	710	Improper Adherence to Coding Standards	1366

## Notes

### Other

This view uses a deep hierarchical organization, with more levels of abstraction than other classification schemes. The top-level entries are called Pillars. Where possible, this view uses abstractions that do not consider particular languages, frameworks, technologies, life cycle development phases, frequency of occurrence, or types of resources. It explicitly identifies relationships that form chains and composites, which have not been a formal part of past classification efforts. Chains and composites might help explain why mutual exclusivity is difficult to achieve within security error taxonomies. This view is roughly aligned with MITRE's research into vulnerability theory, especially with respect to behaviors and resources. Ideally, this view will only cover weakness-to-weakness relationships, with minimal overlap and zero categories.

## View-1003: Weaknesses for Simplified Mapping of Published Vulnerabilities

View ID : 1003

Status: Incomplete

Type : Graph

### Objective

CWE entries in this view (graph) may be used to categorize potential weaknesses within sources that handle public, third-party vulnerability information, such as NVD. By design, this view is incomplete; it is limited to a small number of the most commonly-seen weaknesses, so that it is easier to use for humans. This view is most similar to CWE-699 (Development Concepts), although it also has some relationships that are similar to those for CWE-1000 (Research Concepts). Note: this view is likely to change significantly in the next version.

### Membership

## View-1008: Architectural Concepts

View ID : 1008

Status: Incomplete

Type : Graph

### Objective

This view organizes weaknesses according to common architectural security tactics. It is intended to assist architects in identifying potential mistakes that can be made when designing software.

### Audience

#### Software Designers

Software designers may find this view useful as the weaknesses are organized by known security tactics, aiding the designer in embedding security throughout the design process instead of discovering weaknesses after the software has been built.

#### Educators

Educators may use this view as reference material when discussing security by design or architectural weaknesses, and the types of mistakes that can be made.

### Membership

Nature	Type	ID	Name	Page
HasMember	<b>C</b>	1009	Audit	1844
HasMember	<b>C</b>	1010	Authenticate Actors	1845

HasMember	C	1018	Manage User Sessions	1853
HasMember	C	1019	Validate Inputs	1853
HasMember	C	1020	Verify Message Integrity	1855

## Notes

### Other

The top level categories in this view represent the individual tactics that are part of a secure-by-design approach to software development. The weaknesses that are members of each category contain information about how each is introduced relative to the software's architecture. Three different modes of introduction are used: Omission - caused by missing a security tactic when it is necessary. Commission - refers to incorrect choice of tactics which could result in undesirable consequences. Realization - appropriate security tactics are adopted but are incorrectly implemented.

### Maintenance

This view is under development, and subsequent releases will focus on reviewing the individual weaknesses to verify their inclusion in this view and adding any applicable ChildOf relationships. Comments about revisions are welcome.

## View-1040: Quality Weaknesses with Indirect Security Impacts

View ID : 1040

Status: Incomplete

Type : Implicit

## Objective

CWE identifiers in this view (slice) are quality issues that only indirectly make it easier to introduce a vulnerability and/or make the vulnerability more difficult to detect or mitigate.

## Audience

### Assessment Vendors

This view makes it easier for assessment vendors to identify and improve coverage for quality-related weaknesses.

### Software Developers

This view makes it easier for developers to identify and learn about issues that might make their code more difficult to maintain, perform efficiently or reliably, or secure.

### Software Vendors

This view makes it easier for software vendors to identify important issues that may make their software more difficult to maintain, perform efficiently or reliably, or secure.

## View-1128: CISQ Quality Measures (2016)

**View ID :** 1128 **Status:** Incomplete  
**Type :** Graph

## Objective

CWE nodes in this view (graph) are associated with the Consortium for IT Software Quality (CISQ) Automated Quality Characteristic Measures, released in 2016. These measures are derived from Object Management Group (OMG) standards.

## Audience

### Software Developers

This view outlines the most important software quality issues as identified by the CISQ Automated Quality Characteristic Measures from 2016; it provides a good starting point for application developers who wish to learn more about, or improve their own code quality.

### Software Designers

This view outlines the most important software quality issues as identified by the CISQ Automated Quality Characteristic Measures from 2016; it provides a good starting point for software designers to ensure that code quality issues are considered during the design process.

### Software Vendors

This view outlines the most important software quality issues as identified by the CISQ Automated Quality Characteristic Measures from 2016; it provides a good starting point for software vendors who wish to mark the quality of their software.

### Assessment Vendors

This view outlines the most important software quality issues as identified by the CISQ Automated Quality Characteristic Measures from 2016; it provides a good starting point for assessment vendors who wish to understand what constitutes software with good code quality, using quality issues that are automatically detectable.

### Membership

## View-1133: Weaknesses Addressed by the SEI CERT Oracle Coding Standard for Java

View ID : 1133

Status: Stable

Type : Graph

### Objective

CWE entries in this view (graph) are fully or partially eliminated by following the guidance presented in the online wiki that reflects that current rules and recommendations of the SEI CERT Oracle Coding Standard for Java.

### Audience

#### Software Developers

By following the SEI CERT Oracle Coding Standard for Java, developers will be able to fully or partially prevent the weaknesses that are identified in this view. In addition, developers can use a CWE coverage graph to determine which weaknesses are not directly addressed by the standard, which will help identify and resolve remaining gaps in training, tool acquisition, or other approaches for reducing weaknesses.

#### Software Customers

If a software developer claims to be following the SEI CERT Oracle Secure Coding Standard for Java, then customers can search for the weaknesses in this view in order to formulate independent evidence of that claim.

#### Educators

Educators can use this view in multiple ways. For example, if there is a focus on teaching weaknesses, the educator could link them to the relevant Secure Coding Standard.

## Graph View: CWE-629: Weaknesses in OWASP Top Ten (2007)

- C** CWE-712: OWASP Top Ten 2007 Category A1 - Cross Site Scripting (XSS) (p.1753)
  - B** CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
- C** CWE-713: OWASP Top Ten 2007 Category A2 - Injection Flaws (p.1754)
  - G** CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.140)
  - B** CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
  - B** CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.202)
  - B** CWE-91: XML Injection (aka Blind XPath Injection) (p.204)
  - B** CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.207)
- C** CWE-714: OWASP Top Ten 2007 Category A3 - Malicious File Execution (p.1754)
  - B** CWE-434: Unrestricted Upload of File with Dangerous Type (p.934)
  - B** CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.145)
  - B** CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.214)
  - B** CWE-98: Improper Control of Filename for Include/Require Statement in PHP Program ('PHP Remote File Inclusion') (p.223)
- C** CWE-715: OWASP Top Ten 2007 Category A4 - Insecure Direct Object Reference (p.1754)
  - G** CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.30)
  - B** CWE-472: External Control of Assumed-Immutable Web Parameter (p.1000)
  - B** CWE-639: Authorization Bypass Through User-Controlled Key (p.1250)
- C** CWE-716: OWASP Top Ten 2007 Category A5 - Cross Site Request Forgery (CSRF) (p.1755)
  - B** CWE-352: Cross-Site Request Forgery (CSRF) (p.773)
- C** CWE-717: OWASP Top Ten 2007 Category A6 - Information Leakage and Improper Error Handling (p.1755)
  - G** CWE-200: Information Exposure (p.474)
  - G** CWE-203: Information Exposure Through Discrepancy (p.481)
  - B** CWE-209: Information Exposure Through an Error Message (p.493)
  - V** CWE-215: Information Exposure Through Debug Information (p.509)
- C** CWE-718: OWASP Top Ten 2007 Category A7 - Broken Authentication and Session Management (p.1756)
  - G** CWE-287: Improper Authentication (p.630)
  - V** CWE-301: Reflection Attack in an Authentication Protocol (p.665)
  - B** CWE-522: Insufficiently Protected Credentials (p.1088)
- C** CWE-719: OWASP Top Ten 2007 Category A8 - Insecure Cryptographic Storage (p.1756)
  - B** CWE-311: Missing Encryption of Sensitive Data (p.685)
  - B** CWE-321: Use of Hard-coded Cryptographic Key (p.708)
  - B** CWE-325: Missing Required Cryptographic Step (p.715)
  - G** CWE-326: Inadequate Encryption Strength (p.717)
- C** CWE-720: OWASP Top Ten 2007 Category A9 - Insecure Communications (p.1756)
  - B** CWE-311: Missing Encryption of Sensitive Data (p.685)
  - B** CWE-321: Use of Hard-coded Cryptographic Key (p.708)
  - B** CWE-325: Missing Required Cryptographic Step (p.715)
  - G** CWE-326: Inadequate Encryption Strength (p.717)
- C** CWE-721: OWASP Top Ten 2007 Category A10 - Failure to Restrict URL Access (p.1757)
  - G** CWE-285: Improper Authorization (p.622)
  - B** CWE-288: Authentication Bypass Using an Alternate Path or Channel (p.636)
  - B** CWE-425: Direct Request ('Forced Browsing') (p.914)

## Graph View: CWE-631: DEPRECATED: Resource-specific Weaknesses

- B CWE-791: Incomplete Filtering of Special Elements (p.1475)
- V CWE-792: Incomplete Filtering of One or More Instances of Special Elements (p.1476)
- V CWE-793: Only Filtering One Instance of a Special Element (p.1477)
- V CWE-794: Incomplete Filtering of Multiple Instances of Special Elements (p.1479)
- B CWE-795: Only Filtering Special Elements at a Specified Location (p.1480)
- V CWE-796: Only Filtering Special Elements Relative to a Marker (p.1481)
- V CWE-797: Only Filtering Special Elements at an Absolute Position (p.1483)
- G CWE-75: Failure to Sanitize Special Elements into a Different Plane (Special Element Injection) (p.137)
- B CWE-76: Improper Neutralization of Equivalent Special Elements (p.138)
- G CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.140)
- B CWE-624: Executable Regular Expression Error (p.1235)
- B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.145)
- B CWE-88: Argument Injection or Modification (p.186)
- B CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection') (p.1595)
- B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
- V CWE-80: Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS) (p.169)
- V CWE-81: Improper Neutralization of Script in an Error Message Web Page (p.171)
- V CWE-83: Improper Neutralization of Script in Attributes in a Web Page (p.175)
- V CWE-82: Improper Neutralization of Script in Attributes of IMG Tags in a Web Page (p.174)
- V CWE-84: Improper Neutralization of Encoded URI Schemes in a Web Page (p.178)
- V CWE-85: Doubled Character XSS Manipulations (p.180)
- V CWE-86: Improper Neutralization of Invalid Characters in Identifiers in Web Pages (p.182)
- V CWE-87: Improper Neutralization of Alternate XSS Syntax (p.184)
- B CWE-91: XML Injection (aka Blind XPath Injection) (p.204)
- B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1262)
- B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1277)
- B CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.207)
- G CWE-94: Improper Control of Generation of Code ('Code Injection') (p.209)
- B CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.214)
- B CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (p.218)
- V CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page (p.222)
- G CWE-943: Improper Neutralization of Special Elements in Data Query Logic (p.1621)
- B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1262)
- B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1277)
- B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
- V CWE-564: SQL Injection: Hibernate (p.1136)
- B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.202)
- B CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p.230)
- B CWE-641: Improper Restriction of Names for Files and Other Resources (p.1255)

- B CWE-694: Use of Multiple Resources with Duplicate Identifier (p.1346)
- B CWE-914: Improper Control of Dynamically-Identified Variables (p.1586)
  - B CWE-621: Variable Extraction Error (p.1230)
  - B CWE-627: Dynamic Variable Evaluation (p.1240)
- B CWE-838: Inappropriate Encoding for Output Context (p.1549)
- C CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
  - B CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.286)
    - V CWE-785: Use of Path Manipulation Function without Maximum-sized Buffer (p.1460)
  - B CWE-123: Write-what-where Condition (p.302)
  - B CWE-125: Out-of-bounds Read (p.308)
    - V CWE-126: Buffer Over-read (p.310)
    - V CWE-127: Buffer Under-read (p.313)
  - B CWE-130: Improper Handling of Length Parameter Inconsistency (p.326)
  - B CWE-786: Access of Memory Location Before Start of Buffer (p.1462)
    - B CWE-124: Buffer Underwrite ('Buffer Underflow') (p.304)
      - V CWE-127: Buffer Under-read (p.313)
  - B CWE-787: Out-of-bounds Write (p.1465)
    - V CWE-121: Stack-based Buffer Overflow (p.295)
    - V CWE-122: Heap-based Buffer Overflow (p.298)
    - B CWE-124: Buffer Underwrite ('Buffer Underflow') (p.304)
  - B CWE-788: Access of Memory Location After End of Buffer (p.1466)
    - V CWE-121: Stack-based Buffer Overflow (p.295)
    - V CWE-122: Heap-based Buffer Overflow (p.298)
    - V CWE-126: Buffer Over-read (p.310)
  - B CWE-805: Buffer Access with Incorrect Length Value (p.1495)
    - V CWE-806: Buffer Access Using Size of Source Buffer (p.1501)
  - B CWE-822: Untrusted Pointer Dereference (p.1513)
  - B CWE-823: Use of Out-of-range Pointer Offset (p.1515)
  - B CWE-824: Access of Uninitialized Pointer (p.1518)
  - B CWE-825: Expired Pointer Dereference (p.1520)
- C CWE-133: String Errors (p.1730)
  - B CWE-134: Use of Externally-Controlled Format String (p.339)
  - B CWE-135: Incorrect Calculation of Multi-Byte String Length (p.344)
  - C CWE-251: Often Misused: String Management (p.1733)
    - V CWE-597: Use of Wrong Operator in String Comparison (p.1188)
- C CWE-136: Type Errors (p.1730)
  - C CWE-681: Incorrect Conversion between Numeric Types (p.1322)
    - B CWE-194: Unexpected Sign Extension (p.462)
      - V CWE-195: Signed to Unsigned Conversion Error (p.464)
      - V CWE-196: Unsigned to Signed Conversion Error (p.468)
    - B CWE-197: Numeric Truncation Error (p.469)
  - C CWE-704: Incorrect Type Conversion or Cast (p.1358)
    - B CWE-843: Access of Resource Using Incompatible Type ('Type Confusion') (p.1561)
- C CWE-137: Representation Errors (p.1730)
  - C CWE-138: Improper Neutralization of Special Elements (p.347)
    - B CWE-140: Improper Neutralization of Delimiters (p.350)
      - V CWE-141: Improper Neutralization of Parameter/Argument Delimiters (p.352)
      - V CWE-142: Improper Neutralization of Value Delimiters (p.354)
      - V CWE-143: Improper Neutralization of Record Delimiters (p.355)
      - V CWE-144: Improper Neutralization of Line Delimiters (p.357)
      - V CWE-145: Improper Neutralization of Section Delimiters (p.359)
      - V CWE-146: Improper Neutralization of Expression/Command Delimiters (p.361)
    - V CWE-147: Improper Neutralization of Input Terminators (p.363)
    - V CWE-148: Improper Neutralization of Input Leaders (p.365)
    - V CWE-149: Improper Neutralization of Quoting Syntax (p.366)

- V CWE-150: Improper Neutralization of Escape, Meta, or Control Sequences (p.368)
- V CWE-151: Improper Neutralization of Comment Delimiters (p.371)
- V CWE-152: Improper Neutralization of Macro Symbols (p.373)
- V CWE-153: Improper Neutralization of Substitution Characters (p.374)
- V CWE-154: Improper Neutralization of Variable Name Delimiters (p.376)
- V CWE-155: Improper Neutralization of Wildcards or Matching Symbols (p.378)
- V CWE-156: Improper Neutralization of Whitespace (p.380)
- V CWE-157: Failure to Sanitize Paired Delimiters (p.382)
- V CWE-158: Improper Neutralization of Null Byte or NUL Character (p.384)
- G CWE-159: Failure to Sanitize Special Element (p.386)
  - E CWE-166: Improper Handling of Missing Special Element (p.398)
  - E CWE-167: Improper Handling of Additional Special Element (p.400)
  - E CWE-168: Improper Handling of Inconsistent Special Elements (p.402)
- V CWE-160: Improper Neutralization of Leading Special Elements (p.388)
  - V CWE-161: Improper Neutralization of Multiple Leading Special Elements (p.390)
- V CWE-162: Improper Neutralization of Trailing Special Elements (p.392)
  - V CWE-163: Improper Neutralization of Multiple Trailing Special Elements (p.393)
- V CWE-164: Improper Neutralization of Internal Special Elements (p.395)
  - V CWE-165: Improper Neutralization of Multiple Internal Special Elements (p.397)
- B CWE-170: Improper Null Termination (p.403)
- G CWE-790: Improper Filtering of Special Elements (p.1473)
  - E CWE-791: Incomplete Filtering of Special Elements (p.1475)
    - V CWE-792: Incomplete Filtering of One or More Instances of Special Elements (p.1476)
      - V CWE-793: Only Filtering One Instance of a Special Element (p.1477)
      - V CWE-794: Incomplete Filtering of Multiple Instances of Special Elements (p.1479)
    - E CWE-795: Only Filtering Special Elements at a Specified Location (p.1480)
      - V CWE-796: Only Filtering Special Elements Relative to a Marker (p.1481)
      - V CWE-797: Only Filtering Special Elements at an Absolute Position (p.1483)
- C CWE-171: Cleansing, Canonicalization, and Comparison Errors (p.1731)
  - G CWE-172: Encoding Error (p.407)
    - V CWE-173: Improper Handling of Alternate Encoding (p.410)
    - V CWE-174: Double Decoding of the Same Data (p.411)
    - V CWE-175: Improper Handling of Mixed Encoding (p.413)
    - V CWE-176: Improper Handling of Unicode Encoding (p.415)
    - V CWE-177: Improper Handling of URL Encoding (Hex Encoding) (p.417)
  - B CWE-178: Improper Handling of Case Sensitivity (p.420)
  - B CWE-179: Incorrect Behavior Order: Early Validation (p.423)
  - B CWE-180: Incorrect Behavior Order: Validate Before Canonicalize (p.426)
  - B CWE-181: Incorrect Behavior Order: Validate Before Filter (p.428)
  - B CWE-182: Collapse of Data into Unsafe Value (p.430)
  - B CWE-183: Permissive Whitelist (p.432)
  - B CWE-184: Incomplete Blacklist (p.433)
  - G CWE-185: Incorrect Regular Expression (p.436)
    - E CWE-186: Overly Restrictive Regular Expression (p.439)
    - E CWE-625: Permissive Regular Expression (p.1236)
      - V CWE-777: Regular Expression without Anchors (p.1443)
  - V CWE-187: Partial String Comparison (p.440)
  - V CWE-478: Missing Default Case in Switch Statement (p.1016)
  - V CWE-486: Comparison of Classes by Name (p.1034)
  - V CWE-595: Comparison of Object References Instead of Object Contents (p.1186)
    - V CWE-597: Use of Wrong Operator in String Comparison (p.1188)
  - G CWE-697: Incorrect Comparison (p.1350)
    - E CWE-1023: Incomplete Comparison with Missing Factors (p.1633)
    - E CWE-1024: Comparison of Incompatible Types (p.1634)

- B CWE-1025: Comparison Using Wrong Factors (p.1635)
- G CWE-707: Improper Enforcement of Message or Data Structure (p.1362)
- V CWE-768: Incorrect Short Circuit Evaluation (p.1421)
- B CWE-188: Reliance on Data/Memory Layout (p.443)
- G CWE-228: Improper Handling of Syntactically Invalid Structure (p.522)
- B CWE-229: Improper Handling of Values (p.524)
  - V CWE-230: Improper Handling of Missing Values (p.525)
  - V CWE-231: Improper Handling of Extra Values (p.526)
  - V CWE-232: Improper Handling of Undefined Values (p.527)
- B CWE-233: Improper Handling of Parameters (p.528)
  - V CWE-234: Failure to Handle Missing Parameter (p.530)
  - V CWE-235: Improper Handling of Extra Parameters (p.532)
  - V CWE-236: Improper Handling of Undefined Parameters (p.533)
- B CWE-237: Improper Handling of Structural Elements (p.534)
  - V CWE-238: Improper Handling of Incomplete Structural Elements (p.535)
  - V CWE-239: Failure to Handle Incomplete Element (p.536)
  - B CWE-240: Improper Handling of Inconsistent Structural Elements (p.537)
  - B CWE-241: Improper Handling of Unexpected Data Type (p.538)
- C CWE-199: Information Management Errors (p.1732)
  - G CWE-200: Information Exposure (p.474)
    - V CWE-201: Information Exposure Through Sent Data (p.478)
    - V CWE-202: Exposure of Sensitive Data Through Data Queries (p.480)
    - G CWE-203: Information Exposure Through Discrepancy (p.481)
      - B CWE-204: Response Discrepancy Information Exposure (p.485)
      - B CWE-205: Information Exposure Through Behavioral Discrepancy (p.488)
        - V CWE-206: Information Exposure of Internal State Through Behavioral Inconsistency (p.489)
        - V CWE-207: Information Exposure Through an External Behavioral Inconsistency (p.490)
      - B CWE-208: Information Exposure Through Timing Discrepancy (p.491)
    - B CWE-209: Information Exposure Through an Error Message (p.493)
      - B CWE-210: Information Exposure Through Self-generated Error Message (p.499)
        - V CWE-535: Information Exposure Through Shell Error Message (p.1103)
        - V CWE-536: Information Exposure Through Servlet Runtime Error Message (p.1104)
        - V CWE-537: Information Exposure Through Java Runtime Error Message (p.1105)
      - B CWE-211: Information Exposure Through Externally-Generated Error Message (p.501)
        - V CWE-550: Information Exposure Through Server Error Message (p.1120)
    - B CWE-212: Improper Cross-boundary Removal of Sensitive Data (p.503)
    - B CWE-213: Intentional Information Exposure (p.505)
    - V CWE-214: Information Exposure Through Process Environment (p.507)
    - V CWE-215: Information Exposure Through Debug Information (p.509)
    - B CWE-226: Sensitive Information Uncleared Before Release (p.520)
      - V CWE-244: Improper Clearing of Heap Memory Before Release ('Heap Inspection') (p.543)
    - V CWE-497: Exposure of System Data to an Unauthorized Control Sphere (p.1059)
    - V CWE-524: Information Exposure Through Caching (p.1093)
      - V CWE-525: Information Exposure Through Browser Caching (p.1094)
    - V CWE-526: Information Exposure Through Environmental Variables (p.1095)
    - B CWE-538: File and Directory Information Exposure (p.1107)
      - V CWE-527: Exposure of CVS Repository to an Unauthorized Control Sphere (p.1096)
      - V CWE-528: Exposure of Core Dump File to an Unauthorized Control Sphere (p.1097)
      - V CWE-529: Exposure of Access Control List Files to an Unauthorized Control Sphere (p.1098)
      - V CWE-530: Exposure of Backup File to an Unauthorized Control Sphere (p.1099)
      - V CWE-532: Information Exposure Through Log Files (p.1101)
      - V CWE-539: Information Exposure Through Persistent Cookies (p.1109)

- V CWE-540: Information Exposure Through Source Code (p.1110)
- V CWE-531: Information Exposure Through Test Code (p.1100)
- V CWE-541: Information Exposure Through Include Source Code (p.1111)
- V CWE-615: Information Exposure Through Comments (p.1220)
- V CWE-548: Information Exposure Through Directory Listing (p.1118)
- V CWE-651: Information Exposure Through WSDL File (p.1276)
- V CWE-598: Information Exposure Through Query Strings in GET Request (p.1190)
- V CWE-612: Information Exposure Through Indexing of Private Data (p.1216)
- C CWE-216: Containment Errors (Container Errors) (p.511)
- V CWE-219: Sensitive Data Under Web Root (p.512)
- V CWE-220: Sensitive Data Under FTP Root (p.513)
- C CWE-221: Information Loss or Omission (p.515)
- B CWE-222: Truncation of Security-relevant Information (p.516)
- B CWE-223: Omission of Security-relevant Information (p.517)
- B CWE-778: Insufficient Logging (p.1445)
- B CWE-224: Obscured Security-relevant Information by Alternate Name (p.518)
- B CWE-779: Logging of Excessive Data (p.1447)
- C CWE-20: Improper Input Validation (p.18)
- V CWE-103: Struts: Incomplete validate() Method Definition (p.235)
- V CWE-104: Struts: Form Bean Does Not Extend Validation Class (p.237)
- V CWE-107: Struts: Unused Validation Form (p.245)
- V CWE-110: Struts: Validator Without Form Field (p.250)
- B CWE-111: Direct Use of Unsafe JNI (p.252)
- B CWE-114: Process Control (p.261)
- B CWE-1173: Improper Use of Validation Framework (p.1721)
- V CWE-102: Struts: Duplicate Validation Forms (p.233)
- V CWE-105: Struts: Form Field Without Validator (p.239)
- V CWE-106: Struts: Plug-in Framework not in Use (p.242)
- V CWE-108: Struts: Unvalidated Action Form (p.247)
- V CWE-109: Struts: Validator Turned Off (p.248)
- B CWE-112: Missing XML Validation (p.255)
- V CWE-1174: ASP.NET Misconfiguration: Improper Model Validation (p.1723)
- V CWE-554: ASP.NET Misconfiguration: Not Using Input Validation Framework (p.1125)
- B CWE-129: Improper Validation of Array Index (p.316)
- B CWE-179: Incorrect Behavior Order: Early Validation (p.423)
- B CWE-180: Incorrect Behavior Order: Validate Before Canonicalize (p.426)
- B CWE-181: Incorrect Behavior Order: Validate Before Filter (p.428)
- B CWE-470: Use of Externally-Controlled Input to Select Classes or Code ('Unsafe Reflection') (p.995)
- V CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1194)
- B CWE-606: Unchecked Input for Loop Condition (p.1206)
- V CWE-608: Struts: Non-private Field in ActionForm Class (p.1209)
- V CWE-622: Improper Validation of Function Hook Arguments (p.1232)
- V CWE-626: Null Byte Interaction Error (Poison Null Byte) (p.1238)
- C CWE-73: External Control of File Name or Path (p.128)
- C CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (p.133)
- B CWE-134: Use of Externally-Controlled Format String (p.339)
- C CWE-138: Improper Neutralization of Special Elements (p.347)
- B CWE-140: Improper Neutralization of Delimiters (p.350)
- V CWE-141: Improper Neutralization of Parameter/Argument Delimiters (p.352)
- V CWE-142: Improper Neutralization of Value Delimiters (p.354)
- V CWE-143: Improper Neutralization of Record Delimiters (p.355)
- V CWE-144: Improper Neutralization of Line Delimiters (p.357)
- V CWE-145: Improper Neutralization of Section Delimiters (p.359)

- V CWE-146: Improper Neutralization of Expression/Command Delimiters (p.361)
- V CWE-147: Improper Neutralization of Input Terminators (p.363)
- V CWE-148: Improper Neutralization of Input Leaders (p.365)
- V CWE-149: Improper Neutralization of Quoting Syntax (p.366)
- V CWE-150: Improper Neutralization of Escape, Meta, or Control Sequences (p.368)
- V CWE-151: Improper Neutralization of Comment Delimiters (p.371)
- V CWE-152: Improper Neutralization of Macro Symbols (p.373)
- V CWE-153: Improper Neutralization of Substitution Characters (p.374)
- V CWE-154: Improper Neutralization of Variable Name Delimiters (p.376)
- V CWE-155: Improper Neutralization of Wildcards or Matching Symbols (p.378)
- V CWE-156: Improper Neutralization of Whitespace (p.380)
- V CWE-157: Failure to Sanitize Paired Delimiters (p.382)
- V CWE-158: Improper Neutralization of Null Byte or NUL Character (p.384)

- V CWE-246: J2EE Bad Practices: Direct Use of Sockets (p.547)
- V CWE-574: EJB Bad Practices: Use of Synchronization Primitives (p.1153)
- V CWE-575: EJB Bad Practices: Use of AWT Swing (p.1154)
- V CWE-576: EJB Bad Practices: Use of Java I/O (p.1157)
- V CWE-594: J2EE Framework: Saving Unserializable Objects to Disk (p.1184)
- B CWE-605: Multiple Binds to the Same Port (p.1205)
- G CWE-684: Incorrect Provision of Specified Functionality (p.1331)
- G CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1393)
- B CWE-1102: Reliance on Machine-Dependent Data Representation (p.1700)
- B CWE-474: Use of Function with Inconsistent Implementations (p.1005)
- V CWE-589: Call to Non-ubiquitous API (p.1177)
- B CWE-562: Return of Stack Variable Address (p.1134)
- B CWE-1041: Use of Redundant Code (p.1641)
- B CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range (p.1644)
- B CWE-1048: Invokable Control Element with Large Number of Outward Calls (p.1648)
- G CWE-1059: Incomplete Documentation (p.1658)
- B CWE-1053: Missing Documentation for Design (p.1653)
- B CWE-1110: Incomplete Design Documentation (p.1706)
- B CWE-1111: Incomplete I/O Documentation (p.1707)
- B CWE-1112: Incomplete Documentation of Program Execution (p.1707)
- B CWE-1118: Insufficient Documentation of Error Handling Techniques (p.1712)
- G CWE-1061: Insufficient Encapsulation (p.1660)
- B CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer (p.1654)
- B CWE-1057: Data Access Operations Outside of Expected Data Manager Component (p.1657)
- B CWE-1062: Parent Class with References to Child Class (p.1662)
- B CWE-1083: Data Access from Outside Expected Data Manager Component (p.1681)
- B CWE-1090: Method Containing Access of a Member Element from Another Class (p.1688)
- B CWE-1100: Insufficient Isolation of System-Dependent Functions (p.1698)
- B CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality (p.1702)
- B CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers (p.1665)
- B CWE-1066: Missing Serialization Control Element (p.1666)
- B CWE-1068: Inconsistency Between Implementation and Documented Design (p.1667)

- B CWE-1070: Serializable Data Element Containing non-Serializable Item Elements (p.1669)
- C CWE-1076: Insufficient Adherence to Expected Conventions (p.1675)
- V CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor (p.1645)
- C CWE-1078: Inappropriate Source Code Style or Formatting (p.1677)
  - B CWE-1052: Excessive Use of Hard-Coded Literals in Initialization (p.1652)
  - B CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code (p.1684)
  - B CWE-1099: Inconsistent Naming Conventions for Identifiers (p.1697)
  - B CWE-1106: Insufficient Use of Symbolic Constants (p.1703)
  - B CWE-1107: Insufficient Isolation of Symbolic Constant Definitions (p.1704)
  - B CWE-1109: Use of Same Variable for Multiple Purposes (p.1705)
  - B CWE-1113: Inappropriate Comment Style (p.1708)
  - B CWE-1114: Inappropriate Whitespace Style (p.1709)
  - B CWE-1115: Source Code Element without Standard Prologue (p.1710)
  - B CWE-1116: Inaccurate Comments (p.1710)
  - B CWE-1117: Callable with Insufficient Behavioral Summary (p.1711)
  - V CWE-546: Suspicious Comment (p.1116)
  - V CWE-547: Use of Hard-coded, Security-relevant Constants (p.1117)
- B CWE-1079: Parent Class without Virtual Destructor Method (p.1678)
- B CWE-1082: Class Instance Self Destruction Control Element (p.1680)
- B CWE-1087: Class with Virtual Method without a Virtual Destructor (p.1686)
- B CWE-1091: Use of Object without Invoking Destructor Method (p.1689)
- B CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element (p.1695)
- V CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element (p.1696)
- B CWE-1108: Excessive Reliance on Global Variables (p.1705)
- V CWE-586: Explicit Call to Finalize() (p.1173)
- B CWE-1084: Invokable Control Element with Excessive File or Data Access Operations (p.1682)
- B CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers (p.1690)
- C CWE-1093: Excessively Complex Data Representation (p.1691)
  - B CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements (p.1643)
  - B CWE-1055: Multiple Inheritance from Concrete Classes (p.1655)
  - B CWE-1074: Class with Excessively Deep Inheritance (p.1673)
  - B CWE-1086: Class with Excessive Number of Child Classes (p.1685)
- B CWE-1101: Reliance on Runtime Component in Generated Code (p.1699)
- B CWE-1103: Use of Platform-Dependent Third Party Components (p.1701)
- B CWE-1104: Use of Unmaintained Third Party Components (p.1701)
- C CWE-1120: Excessive Code Complexity (p.1714)
  - B CWE-1047: Modules with Circular Dependencies (p.1647)
  - B CWE-1056: Invokable Control Element with Variadic Parameters (p.1656)
  - B CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses (p.1659)
  - B CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters (p.1664)
  - B CWE-1075: Unconditional Control Flow Transfer outside of Switch Block (p.1674)
  - B CWE-1080: Source Code File with Excessive Number of Lines of Code (p.1679)
  - B CWE-1095: Loop Condition Value Update within the Loop (p.1693)
  - B CWE-1119: Excessive Use of Unconditional Branching (p.1713)
  - B CWE-1121: Excessive McCabe Cyclomatic Complexity (p.1715)
  - B CWE-1122: Excessive Halstead Complexity (p.1716)
  - B CWE-1123: Excessive Use of Self-Modifying Code (p.1717)
  - B CWE-1124: Excessively Deep Nesting (p.1717)
  - B CWE-1125: Excessive Attack Surface (p.1718)
- B CWE-1126: Declaration of Variable with Unnecessarily Wide Scope (p.1719)

- B CWE-1127: Compilation with Insufficient Warnings or Errors (p.1720)
- G CWE-1164: Irrelevant Code (p.1720)
  - V CWE-1071: Empty Code Block (p.1670)
    - V CWE-1069: Empty Exception Block (p.1668)
    - V CWE-585: Empty Synchronized Block (p.1171)
  - V CWE-561: Dead Code (p.1130)
  - V CWE-563: Assignment to Variable without Use (p.1135)
- G CWE-1177: Use of Prohibited Code (p.1724)
  - B CWE-676: Use of Potentially Dangerous Function (p.1317)

  - V CWE-543: Use of Singleton Pattern Without Synchronization in a Multithreaded Context (p.1113)
  - B CWE-770: Allocation of Resources Without Limits or Throttling (p.1423)
  - B CWE-798: Use of Hard-coded Credentials (p.1484)

## Graph View: CWE-868: Weaknesses Addressed by the SEI CERT C++ Coding Standard (2016 Version)

- C** CWE-869: CERT C++ Secure Coding Section 01 - Preprocessor (PRE) (p.1796)
- C** CWE-870: CERT C++ Secure Coding Section 02 - Declarations and Initialization (DCL) (p.1796)
- C** CWE-871: CERT C++ Secure Coding Section 03 - Expressions (EXP) (p.1796)
  - B** CWE-476: NULL Pointer Dereference (p.1008)
  - B** CWE-480: Use of Incorrect Operator (p.1021)
  - V** CWE-768: Incorrect Short Circuit Evaluation (p.1421)
- C** CWE-872: CERT C++ Secure Coding Section 04 - Integers (INT) (p.1797)
  - B** CWE-129: Improper Validation of Array Index (p.316)
  - B** CWE-190: Integer Overflow or Wraparound (p.445)
  - G** CWE-192: Integer Coercion Error (p.454)
  - B** CWE-197: Numeric Truncation Error (p.469)
  - G** CWE-20: Improper Input Validation (p.18)
  - B** CWE-369: Divide By Zero (p.817)
  - B** CWE-466: Return of Pointer Value Outside of Expected Range (p.987)
  - B** CWE-587: Assignment of a Fixed Address to a Pointer (p.1174)
  - B** CWE-606: Unchecked Input for Loop Condition (p.1206)
  - B** CWE-676: Use of Potentially Dangerous Function (p.1317)
  - G** CWE-681: Incorrect Conversion between Numeric Types (p.1322)
  - G** CWE-682: Incorrect Calculation (p.1325)
- C** CWE-873: CERT C++ Secure Coding Section 05 - Floating Point Arithmetic (FLP) (p.1797)
  - B** CWE-369: Divide By Zero (p.817)
  - G** CWE-681: Incorrect Conversion between Numeric Types (p.1322)
  - G** CWE-682: Incorrect Calculation (p.1325)
  - V** CWE-686: Function Call With Incorrect Argument Type (p.1334)
- C** CWE-874: CERT C++ Secure Coding Section 06 - Arrays and the STL (ARR) (p.1798)
  - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
  - B** CWE-129: Improper Validation of Array Index (p.316)
  - V** CWE-467: Use of sizeof() on a Pointer Type (p.989)
  - B** CWE-469: Use of Pointer Subtraction to Determine Size (p.993)
  - G** CWE-665: Improper Initialization (p.1293)
  - B** CWE-805: Buffer Access with Incorrect Length Value (p.1495)
- C** CWE-875: CERT C++ Secure Coding Section 07 - Characters and Strings (STR) (p.1798)
  - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
  - B** CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.286)
  - B** CWE-170: Improper Null Termination (p.403)
  - B** CWE-193: Off-by-one Error (p.457)
  - B** CWE-464: Addition of Data Structure Sentinel (p.986)
  - V** CWE-686: Function Call With Incorrect Argument Type (p.1334)
  - G** CWE-704: Incorrect Type Conversion or Cast (p.1358)
  - B** CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.145)
  - B** CWE-88: Argument Injection or Modification (p.186)
- C** CWE-876: CERT C++ Secure Coding Section 08 - Memory Management (MEM) (p.1799)
  - G** CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
  - B** CWE-128: Wrap-around Error (p.314)
  - B** CWE-131: Incorrect Calculation of Buffer Size (p.330)
  - B** CWE-190: Integer Overflow or Wraparound (p.445)
  - G** CWE-20: Improper Input Validation (p.18)
  - B** CWE-226: Sensitive Information Uncleared Before Release (p.520)
  - V** CWE-244: Improper Clearing of Heap Memory Before Release ('Heap Inspection') (p.543)
  - B** CWE-252: Unchecked Return Value (p.556)

- B CWE-391: Unchecked Error Condition (p.849)
- G CWE-404: Improper Resource Shutdown or Release (p.876)
- V CWE-415: Double Free (p.900)
- B CWE-416: Use After Free (p.903)
- B CWE-476: NULL Pointer Dereference (p.1008)
- V CWE-528: Exposure of Core Dump File to an Unauthorized Control Sphere (p.1097)
- V CWE-590: Free of Memory not on the Heap (p.1178)
- V CWE-591: Sensitive Data Storage in Improperly Locked Memory (p.1181)
- G CWE-665: Improper Initialization (p.1293)
- V CWE-687: Function Call With Incorrectly Specified Argument Value (p.1335)
- B CWE-690: Unchecked Return Value to NULL Pointer Dereference (p.1340)
- G CWE-703: Improper Check or Handling of Exceptional Conditions (p.1355)
- G CWE-754: Improper Check for Unusual or Exceptional Conditions (p.1381)
- V CWE-762: Mismatched Memory Management Routines (p.1406)
- B CWE-770: Allocation of Resources Without Limits or Throttling (p.1423)

    - V CWE-491: Public cloneable() Method Without Final ('Object Hijack') (p.1042)
    - V CWE-493: Critical Public Variable Without Final Modifier (p.1050)
    - V CWE-500: Public Static Field Not Marked Final (p.1065)
    - V CWE-531: Information Exposure Through Test Code (p.1100)
    - V CWE-568: finalize() Method Without super.finalize() (p.1144)
    - V CWE-580: clone() Method Without super.clone() (p.1164)
    - V CWE-582: Array Declared Public, Final, and Static (p.1167)
    - V CWE-583: finalize() Method Declared Public (p.1168)
    - V CWE-608: Struts: Non-private Field in ActionForm Class (p.1209)
    - V CWE-766: Critical Data Element Declared Public (p.1416)
- C CWE-898: SFP Primary Cluster: Authentication (p.1808)
  - C CWE-947: SFP Secondary Cluster: Authentication Bypass (p.1816)
    - G CWE-287: Improper Authentication (p.630)
    - B CWE-288: Authentication Bypass Using an Alternate Path or Channel (p.636)
    - V CWE-289: Authentication Bypass by Alternate Name (p.638)
    - B CWE-303: Incorrect Implementation of Authentication Algorithm (p.669)
    - B CWE-304: Missing Critical Step in Authentication (p.670)
    - B CWE-305: Authentication Bypass by Primary Weakness (p.672)
    - B CWE-308: Use of Single-factor Authentication (p.681)
    - B CWE-309: Use of Password System for Primary Authentication (p.683)
    - B CWE-603: Use of Client-Side Authentication (p.1203)
  - C CWE-948: SFP Secondary Cluster: Digital Certificate (p.1817)
    - B CWE-296: Improper Following of a Certificate's Chain of Trust (p.652)
    - V CWE-297: Improper Validation of Certificate with Host Mismatch (p.655)
    - V CWE-298: Improper Validation of Certificate Expiration (p.658)
    - B CWE-299: Improper Check for Certificate Revocation (p.660)
    - V CWE-593: Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created (p.1182)
    - V CWE-599: Missing Validation of OpenSSL Certificate (p.1191)
  - C CWE-949: SFP Secondary Cluster: Faulty Endpoint Authentication (p.1817)
    - V CWE-293: Using Referer Field for Authentication (p.645)
    - V CWE-302: Authentication Bypass by Assumed-Immutable Data (p.667)
    - G CWE-345: Insufficient Verification of Data Authenticity (p.758)
    - B CWE-346: Origin Validation Error (p.761)
    - V CWE-350: Reliance on Reverse DNS Resolution for a Security-Critical Action (p.769)
    - B CWE-360: Trust of System Event Data (p.791)
    - B CWE-551: Incorrect Behavior Order: Authorization Before Parsing and Canonicalization (p.1121)
    - B CWE-565: Reliance on Cookies without Validation and Integrity Checking (p.1138)
    - V CWE-647: Use of Non-Canonical URL Paths for Authorization Decisions (p.1269)
- C CWE-950: SFP Secondary Cluster: Hardcoded Sensitive Data (p.1818)
  - V CWE-258: Empty Password in Configuration File (p.570)
  - B CWE-259: Use of Hard-coded Password (p.571)
  - B CWE-321: Use of Hard-coded Cryptographic Key (p.708)
  - V CWE-547: Use of Hard-coded, Security-relevant Constants (p.1117)
- C CWE-951: SFP Secondary Cluster: Insecure Authentication Policy (p.1818)
  - V CWE-262: Not Using Password Aging (p.580)
  - B CWE-263: Password Aging with Long Expiration (p.581)
  - B CWE-521: Weak Password Requirements (p.1086)
  - V CWE-556: ASP.NET Misconfiguration: Use of Identity Impersonation (p.1127)
  - B CWE-613: Insufficient Session Expiration (p.1218)
  - B CWE-645: Overly Restrictive Account Lockout Mechanism (p.1266)
- C CWE-952: SFP Secondary Cluster: Missing Authentication (p.1818)

- V CWE-306: Missing Authentication for Critical Function (p.673)
- V CWE-620: Unverified Password Change (p.1228)
- C CWE-953: SFP Secondary Cluster: Missing Endpoint Authentication (p.1819)
  - V CWE-422: Unprotected Windows Messaging Channel ('Shatter') (p.911)
  - B CWE-425: Direct Request ('Forced Browsing') (p.914)
- C CWE-954: SFP Secondary Cluster: Multiple Binds to the Same Port (p.1819)
  - B CWE-605: Multiple Binds to the Same Port (p.1205)
- C CWE-955: SFP Secondary Cluster: Unrestricted Authentication (p.1819)
  - B CWE-307: Improper Restriction of Excessive Authentication Attempts (p.677)
- C CWE-899: SFP Primary Cluster: Access Control (p.1808)
  - C CWE-944: SFP Secondary Cluster: Access Management (p.1815)
    - G CWE-282: Improper Ownership Management (p.616)
    - B CWE-283: Unverified Ownership (p.618)
    - G CWE-284: Improper Access Control (p.619)
    - G CWE-286: Incorrect User Management (p.629)
    - B CWE-708: Incorrect Ownership Assignment (p.1364)
  - C CWE-945: SFP Secondary Cluster: Insecure Resource Access (p.1816)
    - G CWE-285: Improper Authorization (p.622)
    - G CWE-424: Improper Protection of Alternate Path (p.913)
    - B CWE-639: Authorization Bypass Through User-Controlled Key (p.1250)
    - V CWE-650: Trusting HTTP Permission Methods on the Server Side (p.1275)
  - C CWE-946: SFP Secondary Cluster: Insecure Resource Permissions (p.1816)
    - V CWE-276: Incorrect Default Permissions (p.606)
    - V CWE-277: Insecure Inherited Permissions (p.609)
    - V CWE-278: Insecure Preserved Inherited Permissions (p.610)
    - V CWE-279: Incorrect Execution-Assigned Permissions (p.611)
    - B CWE-281: Improper Preservation of Permissions (p.615)
    - V CWE-560: Use of umask() with chmod-style Argument (p.1129)
    - G CWE-732: Incorrect Permission Assignment for Critical Resource (p.1367)
- C CWE-901: SFP Primary Cluster: Privilege (p.1808)
  - G CWE-250: Execution with Unnecessary Privileges (p.550)
  - B CWE-266: Incorrect Privilege Assignment (p.583)
  - B CWE-267: Privilege Defined With Unsafe Actions (p.586)
  - B CWE-268: Privilege Chaining (p.589)
  - G CWE-269: Improper Privilege Management (p.591)
  - B CWE-270: Privilege Context Switching Error (p.593)
  - G CWE-271: Privilege Dropping / Lowering Errors (p.595)
  - B CWE-272: Least Privilege Violation (p.598)
  - B CWE-274: Improper Handling of Insufficient Privileges (p.604)
  - V CWE-520: .NET Misconfiguration: Use of Impersonation (p.1085)
  - B CWE-653: Insufficient Compartmentalization (p.1279)
  - V CWE-9: J2EE Misconfiguration: Weak Access Permissions for EJB Methods (p.7)
- C CWE-902: SFP Primary Cluster: Channel (p.1809)
  - C CWE-956: SFP Secondary Cluster: Channel Attack (p.1820)
    - B CWE-290: Authentication Bypass by Spoofing (p.640)
    - B CWE-294: Authentication Bypass by Capture-replay (p.647)
    - G CWE-300: Channel Accessible by Non-Endpoint ('Man-in-the-Middle') (p.662)
    - V CWE-301: Reflection Attack in an Authentication Protocol (p.665)
    - B CWE-419: Unprotected Primary Channel (p.907)
    - B CWE-420: Unprotected Alternate Channel (p.908)
    - B CWE-421: Race Condition During Access to Alternate Channel (p.910)
    - G CWE-441: Unintended Proxy or Intermediary ('Confused Deputy') (p.949)
  - C CWE-957: SFP Secondary Cluster: Protocol Error (p.1820)
    - B CWE-353: Missing Support for Integrity Check (p.780)
    - G CWE-435: Improper Interaction Between Multiple Correctly-Behaving Entities (p.942)

- B CWE-436: Interpretation Conflict (p.943)
- B CWE-437: Incomplete Model of Endpoint Features (p.946)
- C CWE-757: Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade') (p.1392)
- C CWE-903: SFP Primary Cluster: Cryptography (p.1809)
  - C CWE-958: SFP Secondary Cluster: Broken Cryptography (p.1820)
    - B CWE-325: Missing Required Cryptographic Step (p.715)
    - B CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.719)
    - B CWE-328: Reversible One-Way Hash (p.725)
    - B CWE-759: Use of a One-Way Hash without a Salt (p.1395)
    - B CWE-760: Use of a One-Way Hash with a Predictable Salt (p.1400)
  - C CWE-959: SFP Secondary Cluster: Weak Cryptography (p.1821)
    - V CWE-261: Weak Cryptography for Passwords (p.578)
    - B CWE-322: Key Exchange without Entity Authentication (p.710)
    - B CWE-323: Reusing a Nonce, Key Pair in Encryption (p.712)
    - B CWE-324: Use of a Key Past its Expiration Date (p.714)
    - C CWE-326: Inadequate Encryption Strength (p.717)
    - V CWE-329: Not Using a Random IV with CBC Mode (p.728)
    - B CWE-347: Improper Verification of Cryptographic Signature (p.764)
    - B CWE-640: Weak Password Recovery Mechanism for Forgotten Password (p.1252)
- C CWE-904: SFP Primary Cluster: Malware (p.1809)
  - C CWE-506: Embedded Malicious Code (p.1074)
  - B CWE-507: Trojan Horse (p.1076)
  - B CWE-508: Non-Replicating Malicious Code (p.1077)
  - B CWE-509: Replicating Malicious Code (Virus or Worm) (p.1078)
  - B CWE-510: Trapdoor (p.1079)
  - B CWE-511: Logic/Time Bomb (p.1080)
  - B CWE-512: Spyware (p.1082)
  - V CWE-69: Improper Handling of Windows ::DATA Alternate Data Stream (p.125)
  - C CWE-968: SFP Secondary Cluster: Covert Channel (p.1826)
    - B CWE-385: Covert Timing Channel (p.841)
    - C CWE-514: Covert Channel (p.1083)
    - B CWE-515: Covert Storage Channel (p.1084)
- C CWE-905: SFP Primary Cluster: Predictability (p.1810)
  - C CWE-330: Use of Insufficiently Random Values (p.729)
  - B CWE-331: Insufficient Entropy (p.736)
  - V CWE-332: Insufficient Entropy in PRNG (p.738)
  - V CWE-333: Improper Handling of Insufficient Entropy in TRNG (p.740)
  - B CWE-334: Small Space of Random Values (p.741)
  - B CWE-335: Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG) (p.743)
  - B CWE-336: Same Seed in Pseudo-Random Number Generator (PRNG) (p.745)
  - B CWE-337: Predictable Seed in Pseudo-Random Number Generator (PRNG) (p.746)
  - B CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) (p.748)
  - B CWE-339: Small Seed Space in PRNG (p.750)
  - C CWE-340: Predictability Problems (p.751)
  - B CWE-341: Predictable from Observable State (p.752)
  - B CWE-342: Predictable Exact Value from Previous Values (p.754)
  - B CWE-343: Predictable Value Range from Previous Values (p.756)
  - B CWE-344: Use of Invariant Value in Dynamically Changing Context (p.757)
- C CWE-906: SFP Primary Cluster: UI (p.1810)
  - C CWE-995: SFP Secondary Cluster: Feature (p.1839)
    - B CWE-447: Unimplemented or Unsupported Feature in UI (p.957)
    - B CWE-448: Obsolete Feature in UI (p.958)
    - B CWE-449: The UI Performs the Wrong Action (p.959)
    - B CWE-450: Multiple Interpretations of UI Input (p.960)

- C CWE-451: User Interface (UI) Misrepresentation of Critical Information (p.961)
- V CWE-549: Missing Password Field Masking (p.1120)
- B CWE-655: Insufficient Psychological Acceptability (p.1283)
- C CWE-996: SFP Secondary Cluster: Security (p.1840)
  - B CWE-356: Product UI does not Warn User of Unsafe Actions (p.784)
  - B CWE-357: Insufficient UI Warning of Dangerous Operations (p.785)
  - B CWE-446: UI Discrepancy for Security Feature (p.956)
- C CWE-997: SFP Secondary Cluster: Information Loss (p.1840)
  - C CWE-221: Information Loss or Omission (p.515)
  - B CWE-222: Truncation of Security-relevant Information (p.516)
  - B CWE-223: Omission of Security-relevant Information (p.517)
  - B CWE-224: Obscured Security-relevant Information by Alternate Name (p.518)
- C CWE-907: SFP Primary Cluster: Other (p.1811)
  - C CWE-975: SFP Secondary Cluster: Architecture (p.1828)
    - B CWE-348: Use of Less Trusted Source (p.766)
    - C CWE-359: Exposure of Private Information ('Privacy Violation') (p.788)
    - B CWE-602: Client-Side Enforcement of Server-Side Security (p.1200)
    - C CWE-637: Unnecessary Complexity in Protection Mechanism (Not Using 'Economy of Mechanism') (p.1247)
    - B CWE-649: Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking (p.1273)
    - B CWE-654: Reliance on a Single Factor in a Security Decision (p.1281)
    - B CWE-656: Reliance on Security Through Obscurity (p.1285)
    - C CWE-657: Violation of Secure Design Principles (p.1287)
    - C CWE-671: Lack of Administrator Control over Security (p.1309)
    - C CWE-693: Protection Mechanism Failure (p.1344)
    - B CWE-749: Exposed Dangerous Method or Function (p.1377)
  - C CWE-976: SFP Secondary Cluster: Compiler (p.1829)
    - B CWE-733: Compiler Optimization Removal or Modification of Security-critical Code (p.1376)
  - C CWE-977: SFP Secondary Cluster: Design (p.1829)
    - B CWE-115: Misinterpretation of Input (p.264)
    - V CWE-187: Partial String Comparison (p.440)
    - B CWE-188: Reliance on Data/Memory Layout (p.443)
    - B CWE-193: Off-by-one Error (p.457)
    - B CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data (p.768)
    - C CWE-405: Asymmetric Resource Consumption (Amplification) (p.881)
    - B CWE-406: Insufficient Control of Network Message Volume (Network Amplification) (p.883)
    - B CWE-407: Algorithmic Complexity (p.885)
    - B CWE-408: Incorrect Behavior Order: Early Amplification (p.887)
    - B CWE-409: Improper Handling of Highly Compressed Data (Data Amplification) (p.889)
    - B CWE-410: Insufficient Resource Pool (p.891)
    - B CWE-430: Deployment of Wrong Handler (p.929)
    - B CWE-462: Duplicate Key in Associative List (Alist) (p.982)
    - B CWE-463: Deletion of Data Structure Sentinel (p.984)
    - B CWE-464: Addition of Data Structure Sentinel (p.986)
    - B CWE-480: Use of Incorrect Operator (p.1021)
    - V CWE-483: Incorrect Block Delimitation (p.1029)
    - B CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined (p.1165)
    - V CWE-595: Comparison of Object References Instead of Object Contents (p.1186)
    - B CWE-618: Exposed Unsafe ActiveX Method (p.1225)
    - B CWE-648: Incorrect Use of Privileged APIs (p.1271)
    - C CWE-670: Always-Incorrect Control Flow Implementation (p.1308)
    - C CWE-682: Incorrect Calculation (p.1325)
    - C CWE-691: Insufficient Control Flow Management (p.1342)
    - C CWE-696: Incorrect Behavior Order (p.1349)

-  CWE-697: Incorrect Comparison (*p.1350*)
-  CWE-698: Execution After Redirect (EAR) (*p.1354*)
-  CWE-705: Incorrect Control Flow Scoping (*p.1359*)
-  CWE-978: SFP Secondary Cluster: Implementation (*p.1830*)
-  CWE-216: Containment Errors (Container Errors) (*p.511*)
-  CWE-358: Improperly Implemented Security Check for Standard (*p.786*)
-  CWE-398: 7PK - Code Quality (*p.1744*)
-  CWE-623: Unsafe ActiveX Control Marked Safe For Scripting (*p.1233*)
-  CWE-710: Improper Adherence to Coding Standards (*p.1366*)

## Graph View: CWE-900: Weaknesses in the 2011 CWE/SANS Top 25 Most Dangerous Software Errors

- C** CWE-867: 2011 Top 25 - Weaknesses On the Cusp (p.1795)
  - B** CWE-129: Improper Validation of Array Index (p.316)
  - B** CWE-209: Information Exposure Through an Error Message (p.493)
  - B** CWE-212: Improper Cross-boundary Removal of Sensitive Data (p.503)
  - G** CWE-330: Use of Insufficiently Random Values (p.729)
  - G** CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') (p.793)
  - B** CWE-456: Missing Initialization of a Variable (p.971)
  - B** CWE-476: NULL Pointer Dereference (p.1008)
  - G** CWE-681: Incorrect Conversion between Numeric Types (p.1322)
  - G** CWE-754: Improper Check for Unusual or Exceptional Conditions (p.1381)
  - B** CWE-770: Allocation of Resources Without Limits or Throttling (p.1423)
  - B** CWE-772: Missing Release of Resource after Effective Lifetime (p.1432)
  - B** CWE-805: Buffer Access with Incorrect Length Value (p.1495)
  - B** CWE-822: Untrusted Pointer Dereference (p.1513)
  - B** CWE-825: Expired Pointer Dereference (p.1520)
  - B** CWE-838: Inappropriate Encoding for Output Context (p.1549)
  - B** CWE-841: Improper Enforcement of Behavioral Workflow (p.1556)
- C** CWE-866: 2011 Top 25 - Porous Defenses (p.1794)
  - G** CWE-250: Execution with Unnecessary Privileges (p.550)
  - V** CWE-306: Missing Authentication for Critical Function (p.673)
  - B** CWE-307: Improper Restriction of Excessive Authentication Attempts (p.677)
  - B** CWE-311: Missing Encryption of Sensitive Data (p.685)
  - B** CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.719)
  - G** CWE-732: Incorrect Permission Assignment for Critical Resource (p.1367)
  - B** CWE-759: Use of a One-Way Hash without a Salt (p.1395)
  - B** CWE-798: Use of Hard-coded Credentials (p.1484)
  - B** CWE-807: Reliance on Untrusted Inputs in a Security Decision (p.1505)
  - G** CWE-862: Missing Authorization (p.1564)
  - G** CWE-863: Incorrect Authorization (p.1570)
- C** CWE-865: 2011 Top 25 - Risky Resource Management (p.1794)
  - B** CWE-120: Buffer Copy without Checking Size of Input ('Classic Buffer Overflow') (p.286)
  - B** CWE-131: Incorrect Calculation of Buffer Size (p.330)
  - B** CWE-134: Use of Externally-Controlled Format String (p.339)
  - B** CWE-190: Integer Overflow or Wraparound (p.445)
  - G** CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.30)
  - B** CWE-494: Download of Code Without Integrity Check (p.1052)
  - B** CWE-676: Use of Potentially Dangerous Function (p.1317)
- C** CWE-864: 2011 Top 25 - Insecure Interaction Between Components (p.1793)
  - B** CWE-352: Cross-Site Request Forgery (CSRF) (p.773)
  - B** CWE-434: Unrestricted Upload of File with Dangerous Type (p.934)
  - V** CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1194)
  - B** CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.145)
  - B** CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
  - G** CWE-829: Inclusion of Functionality from Untrusted Control Sphere (p.1529)
  - B** CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)

## Graph View: CWE-928: Weaknesses in OWASP Top Ten (2013)

- C** CWE-929: OWASP Top Ten 2013 Category A1 - Injection (*p.1811*)
  - G** CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (*p.133*)
  - G** CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (*p.140*)
  - B** CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (*p.145*)
  - B** CWE-88: Argument Injection or Modification (*p.186*)
  - B** CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (*p.191*)
  - V** CWE-564: SQL Injection: Hibernate (*p.1136*)
  - B** CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (*p.202*)
  - B** CWE-91: XML Injection (aka Blind XPath Injection) (*p.204*)
  - B** CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (*p.1262*)

- B CWE-130: Improper Handling of Length Parameter Inconsistency (p.326)
- B CWE-463: Deletion of Data Structure Sentinel (p.984)
- C CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (p.133)
  - B CWE-134: Use of Externally-Controlled Format String (p.339)
  - C CWE-75: Failure to Sanitize Special Elements into a Different Plane (Special Element Injection) (p.137)
    - B CWE-76: Improper Neutralization of Equivalent Special Elements (p.138)
  - C CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.140)
    - B CWE-624: Executable Regular Expression Error (p.1235)
    - B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.145)
    - B CWE-88: Argument Injection or Modification (p.186)
    - B CWE-917: Improper Neutralization of Special Elements used in an Expression Language Statement ('Expression Language Injection') (p.1595)
  - B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
    - E CWE-692: Incomplete Blacklist to Cross-Site Scripting (p.1343)
    - V CWE-80: Improper Neutralization of Script-Related HTML Tags in a Web Page (Basic XSS) (p.169)
    - V CWE-81: Improper Neutralization of Script in an Error Message Web Page (p.171)
    - V CWE-83: Improper Neutralization of Script in Attributes in a Web Page (p.175)
      - V CWE-82: Improper Neutralization of Script in Attributes of IMG Tags in a Web Page (p.174)
    - V CWE-84: Improper Neutralization of Encoded URI Schemes in a Web Page (p.178)
    - V CWE-85: Doubled Character XSS Manipulations (p.180)
    - V CWE-86: Improper Neutralization of Invalid Characters in Identifiers in Web Pages (p.182)
    - V CWE-87: Improper Neutralization of Alternate XSS Syntax (p.184)
  - B CWE-91: XML Injection (aka Blind XPath Injection) (p.204)
    - B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1262)
    - B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1277)
  - B CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.207)
    - B CWE-113: Improper Neutralization of CRLF Sequences in HTTP Headers ('HTTP Response Splitting') (p.256)
  - C CWE-94: Improper Control of Generation of Code ('Code Injection') (p.209)
    - B CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (p.214)
    - B CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (p.218)
      - V CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page (p.222)
  - C CWE-943: Improper Neutralization of Special Elements in Data Query Logic (p.1621)
    - B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1262)
    - B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1277)

- B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
- V CWE-564: SQL Injection: Hibernate (p.1136)
- B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.202)
- B CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p.230)
- B CWE-641: Improper Restriction of Names for Files and Other Resources (p.1255)
- B CWE-694: Use of Multiple Resources with Duplicate Identifier (p.1346)
- V CWE-102: Struts: Duplicate Validation Forms (p.233)
- B CWE-462: Duplicate Key in Associative List (AList) (p.982)
- B CWE-914: Improper Control of Dynamically-Identified Variables (p.1586)
- B CWE-621: Variable Extraction Error (p.1230)
- B CWE-627: Dynamic Variable Evaluation (p.1240)
- G CWE-710: Improper Adherence to Coding Standards (p.1366)
- B CWE-1041: Use of Redundant Code (p.1641)
- B CWE-1044: Architecture with Number of Horizontal Layers Outside of Expected Range (p.1644)
- B CWE-1048: Invokable Control Element with Large Number of Outward Calls (p.1648)
- G CWE-1059: Incomplete Documentation (p.1658)
- B CWE-1053: Missing Documentation for Design (p.1653)
- B CWE-1110: Incomplete Design Documentation (p.1706)
- B CWE-1111: Incomplete I/O Documentation (p.1707)
- B CWE-1112: Incomplete Documentation of Program Execution (p.1707)
- B CWE-1118: Insufficient Documentation of Error Handling Techniques (p.1712)
- G CWE-1061: Insufficient Encapsulation (p.1660)
- B CWE-1054: Invocation of a Control Element at an Unnecessarily Deep Horizontal Layer (p.1654)
- B CWE-1057: Data Access Operations Outside of Expected Data Manager Component (p.1657)
- B CWE-1062: Parent Class with References to Child Class (p.1662)
- B CWE-1083: Data Access from Outside Expected Data Manager Component (p.1681)
- B CWE-1090: Method Containing Access of a Member Element from Another Class (p.1688)
- B CWE-1100: Insufficient Isolation of System-Dependent Functions (p.1698)
- B CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality (p.1702)
- B CWE-188: Reliance on Data/Memory Layout (p.443)
- B CWE-198: Use of Incorrect Byte Ordering (p.473)
- V CWE-766: Critical Data Element Declared Public (p.1416)
- B CWE-1065: Runtime Resource Management Control Element in a Component Built to Run on Application Servers (p.1665)
- B CWE-1066: Missing Serialization Control Element (p.1666)
- B CWE-1068: Inconsistency Between Implementation and Documented Design (p.1667)
- V CWE-107: Struts: Unused Validation Form (p.245)
- B CWE-1070: Serializable Data Element Containing non-Serializable Item Elements (p.1669)
- G CWE-1076: Insufficient Adherence to Expected Conventions (p.1675)
- V CWE-1045: Parent Class with a Virtual Destructor and a Child Class without a Virtual Destructor (p.1645)
- G CWE-1078: Inappropriate Source Code Style or Formatting (p.1677)
- B CWE-1085: Invokable Control Element with Excessive Volume of Commented-out Code (p.1684)
- B CWE-1099: Inconsistent Naming Conventions for Identifiers (p.1697)
- B CWE-1106: Insufficient Use of Symbolic Constants (p.1703)
- B CWE-1107: Insufficient Isolation of Symbolic Constant Definitions (p.1704)
- B CWE-1109: Use of Same Variable for Multiple Purposes (p.1705)
- B CWE-1113: Inappropriate Comment Style (p.1708)
- B CWE-1114: Inappropriate Whitespace Style (p.1709)
- B CWE-1115: Source Code Element without Standard Prologue (p.1710)
- B CWE-1116: Inaccurate Comments (p.1710)
- B CWE-1117: Callable with Insufficient Behavioral Summary (p.1711)
- V CWE-546: Suspicious Comment (p.1116)

- V CWE-547: Use of Hard-coded, Security-relevant Constants (p.1117)
- B CWE-1079: Parent Class without Virtual Destructor Method (p.1678)
- B CWE-1082: Class Instance Self Destruction Control Element (p.1680)
- B CWE-1087: Class with Virtual Method without a Virtual Destructor (p.1686)
- B CWE-1091: Use of Object without Invoking Destructor Method (p.1689)
- B CWE-1097: Persistent Storable Data Element without Associated Comparison Control Element (p.1695)
- V CWE-1098: Data Element containing Pointer Item without Proper Copy Control Element (p.1696)
- B CWE-1108: Excessive Reliance on Global Variables (p.1705)
- V CWE-586: Explicit Call to Finalize() (p.1173)
- B CWE-1092: Use of Same Invokable Control Element in Multiple Architectural Layers (p.1690)
- G CWE-1093: Excessively Complex Data Representation (p.1691)
  - B CWE-1043: Data Element Aggregating an Excessively Large Number of Non-Primitive Elements (p.1643)
  - B CWE-1055: Multiple Inheritance from Concrete Classes (p.1655)
  - B CWE-1074: Class with Excessively Deep Inheritance (p.1673)
  - B CWE-1086: Class with Excessive Number of Child Classes (p.1685)
- V CWE-110: Struts: Validator Without Form Field (p.250)
- B CWE-1101: Reliance on Runtime Component in Generated Code (p.1699)
- B CWE-1104: Use of Unmaintained Third Party Components (p.1701)
- G CWE-1120: Excessive Code Complexity (p.1714)
  - B CWE-1047: Modules with Circular Dependencies (p.1647)
  - B CWE-1056: Invokable Control Element with Variadic Parameters (p.1656)
  - B CWE-1060: Excessive Number of Inefficient Server-Side Data Accesses (p.1659)
  - B CWE-1064: Invokable Control Element with Signature Containing an Excessive Number of Parameters (p.1664)
  - B CWE-1075: Unconditional Control Flow Transfer outside of Switch Block (p.1674)
  - B CWE-1080: Source Code File with Excessive Number of Lines of Code (p.1679)
  - B CWE-1095: Loop Condition Value Update within the Loop (p.1693)
  - B CWE-1119: Excessive Use of Unconditional Branching (p.1713)
  - B CWE-1121: Excessive McCabe Cyclomatic Complexity (p.1715)
  - B CWE-1122: Excessive Halstead Complexity (p.1716)
  - B CWE-1123: Excessive Use of Self-Modifying Code (p.1717)
  - B CWE-1124: Excessively Deep Nesting (p.1717)
  - B CWE-1125: Excessive Attack Surface (p.1718)
- B CWE-1126: Declaration of Variable with Unnecessarily Wide Scope (p.1719)
- B CWE-1127: Compilation with Insufficient Warnings or Errors (p.1720)
- G CWE-1164: Irrelevant Code (p.1720)
  - V CWE-1071: Empty Code Block (p.1670)
    - V CWE-1069: Empty Exception Block (p.1668)
    - V CWE-585: Empty Synchronized Block (p.1171)
  - V CWE-561: Dead Code (p.1130)
  - V CWE-563: Assignment to Variable without Use (p.1135)
- G CWE-1177: Use of Prohibited Code (p.1724)
  - B CWE-242: Use of Inherently Dangerous Function (p.540)
  - B CWE-676: Use of Potentially Dangerous Function (p.1317)
    - V CWE-785: Use of Path Manipulation Function without Maximum-sized Buffer (p.1460)
- B CWE-476: NULL Pointer Dereference (p.1008)
- ∞ CWE-690: Unchecked Return Value to NULL Pointer Dereference (p.1340)
- B CWE-477: Use of Obsolete Function (p.1013)
- B CWE-484: Omitted Break Statement in Switch (p.1031)
- B CWE-489: Leftover Debug Code (p.1040)
- G CWE-506: Embedded Malicious Code (p.1074)
  - B CWE-507: Trojan Horse (p.1076)
    - B CWE-508: Non-Replicating Malicious Code (p.1077)

- B CWE-509: Replicating Malicious Code (Virus or Worm) (p.1078)
- B CWE-510: Trapdoor (p.1079)
- B CWE-511: Logic/Time Bomb (p.1080)
- B CWE-512: Spyware (p.1082)
- V CWE-570: Expression is Always False (p.1145)
- V CWE-571: Expression is Always True (p.1148)
- G CWE-573: Improper Following of Specification by Caller (p.1151)
  - V CWE-103: Struts: Incomplete validate() Method Definition (p.235)
  - V CWE-104: Struts: Form Bean Does Not Extend Validation Class (p.237)
  - V CWE-243: Creation of chroot Jail Without Changing Working Directory (p.542)
  - B CWE-253: Incorrect Check of Function Return Value (p.563)
  - B CWE-296: Improper Following of a Certificate's Chain of Trust (p.652)
  - B CWE-304: Missing Critical Step in Authentication (p.670)
  - B CWE-325: Missing Required Cryptographic Step (p.715)
  - V CWE-329: Not Using a Random IV with CBC Mode (p.728)
  - B CWE-358: Improperly Implemented Security Check for Standard (p.786)
  - B CWE-475: Undefined Behavior for Input to API (p.1007)
  - V CWE-568: finalize() Method Without super.finalize() (p.1144)
  - V CWE-577: EJB Bad Practices: Use of Sockets (p.1159)
  - V CWE-578: EJB Bad Practices: Use of Class Loader (p.1161)
  - V CWE-579: J2EE Bad Practices: Non-serializable Object Stored in Session (p.1163)
  - V CWE-580: clone() Method Without super.clone() (p.1164)
  - B CWE-581: Object Model Violation: Just One of Equals and Hashcode Defined (p.1165)
  - B CWE-628: Function Call with Incorrectly Specified Arguments (p.1242)
    - V CWE-683: Function Call With Incorrect Order of Arguments (p.1330)
    - V CWE-685: Function Call With Incorrect Number of Arguments (p.1333)
    - V CWE-686: Function Call With Incorrect Argument Type (p.1334)
    - V CWE-687: Function Call With Incorrectly Specified Argument Value (p.1335)
    - V CWE-560: Use of umask() with chmod-style Argument (p.1129)
    - V CWE-688: Function Call With Incorrect Variable or Reference as Argument (p.1337)
  - G CWE-675: Duplicate Operations on Resource (p.1316)
    - V CWE-174: Double Decoding of the Same Data (p.411)
    - V CWE-415: Double Free (p.900)
  - B CWE-605: Multiple Binds to the Same Port (p.1205)
  - V CWE-764: Multiple Locks of a Critical Resource (p.1413)
  - V CWE-765: Multiple Unlocks of a Critical Resource (p.1415)
- B CWE-694: Use of Multiple Resources with Duplicate Identifier (p.1346)
  - V CWE-102: Struts: Duplicate Validation Forms (p.233)
  - B CWE-462: Duplicate Key in Associative List (Alist) (p.982)
- B CWE-695: Use of Low-Level Functionality (p.1348)
  - B CWE-111: Direct Use of Unsafe JNI (p.252)
    - V CWE-245: J2EE Bad Practices: Direct Management of Connections (p.545)
    - V CWE-246: J2EE Bad Practices: Direct Use of Sockets (p.547)
    - V CWE-383: J2EE Bad Practices: Direct Use of Threads (p.836)
    - V CWE-574: EJB Bad Practices: Use of Synchronization Primitives (p.1153)
    - V CWE-575: EJB Bad Practices: Use of AWT Swing (p.1154)
    - V CWE-576: EJB Bad Practices: Use of Java I/O (p.1157)
- V CWE-594: J2EE Framework: Saving Unserializable Objects to Disk (p.1184)
- G CWE-657: Violation of Secure Design Principles (p.1287)
  - G CWE-250: Execution with Unnecessary Privileges (p.550)
  - G CWE-636: Not Failing Securely ('Failing Open') (p.1245)
  - B CWE-455: Non-exit on Failed Initialization (p.969)
  - G CWE-637: Unnecessary Complexity in Protection Mechanism (Not Using 'Economy of Mechanism') (p.1247)
  - G CWE-638: Not Using Complete Mediation (p.1248)

- C CWE-424: Improper Protection of Alternate Path (p.913)
  - B CWE-425: Direct Request ('Forced Browsing') (p.914)
- B CWE-653: Insufficient Compartmentalization (p.1279)
- B CWE-654: Reliance on a Single Factor in a Security Decision (p.1281)
  - B CWE-308: Use of Single-factor Authentication (p.681)
  - B CWE-309: Use of Password System for Primary Authentication (p.683)
- B CWE-655: Insufficient Psychological Acceptability (p.1283)
- B CWE-656: Reliance on Security Through Obscurity (p.1285)
- C CWE-671: Lack of Administrator Control over Security (p.1309)
  - B CWE-447: Unimplemented or Unsupported Feature in UI (p.957)
  - B CWE-798: Use of Hard-coded Credentials (p.1484)
    - B CWE-259: Use of Hard-coded Password (p.571)
    - B CWE-321: Use of Hard-coded Cryptographic Key (p.708)
- C CWE-684: Incorrect Provision of Specified Functionality (p.1331)
  - B CWE-392: Missing Report of Error Condition (p.851)
  - B CWE-393: Return of Wrong Status Code (p.853)
  - B CWE-440: Expected Behavior Violation (p.948)
  - B CWE-446: UI Discrepancy for Security Feature (p.956)
    - B CWE-447: Unimplemented or Unsupported Feature in UI (p.957)
    - B CWE-448: Obsolete Feature in UI (p.958)
    - B CWE-449: The UI Performs the Wrong Action (p.959)
  - C CWE-451: User Interface (UI) Misrepresentation of Critical Information (p.961)
    - B CWE-1007: Insufficient Visual Distinction of Homoglyphs Presented to User (p.1626)
    - B CWE-1021: Improper Restriction of Rendered UI Layers or Frames (p.1628)
- C CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1393)
  - C CWE-1038: Insecure Automated Optimizations (p.1638)
    - B CWE-1037: Processor Optimization Removal or Modification of Security-critical Code (p.1637)
    - B CWE-733: Compiler Optimization Removal or Modification of Security-critical Code (p.1376)
      - V CWE-14: Compiler Removal of Code to Clear Buffers (p.13)
  - B CWE-1102: Reliance on Machine-Dependent Data Representation (p.1700)
  - B CWE-1103: Use of Platform-Dependent Third Party Components (p.1701)
  - B CWE-1105: Insufficient Encapsulation of Machine-Dependent Functionality (p.1702)
    - B CWE-188: Reliance on Data/Memory Layout (p.443)
      - B CWE-198: Use of Incorrect Byte Ordering (p.473)
  - B CWE-474: Use of Function with Inconsistent Implementations (p.1005)
    - V CWE-589: Call to Non-ubiquitous API (p.1177)
  - B CWE-562: Return of Stack Variable Address (p.1134)
  - B CWE-587: Assignment of a Fixed Address to a Pointer (p.1174)
  - V CWE-588: Attempt to Access Child of a Non-structure Pointer (p.1176)
- C CWE-912: Hidden Functionality (p.1584)

## Graph View: CWE-1003: Weaknesses for Simplified Mapping of Published Vulnerabilities

- C CWE-16: Configuration (p.1727)
- C CWE-17: Code (p.1727)
  - C CWE-18: Source Code (p.1728)
    - C CWE-19: Data Processing Errors (p.1728)
      - G CWE-118: Incorrect Access of Indexable Resource ('Range Error') (p.275)
      - G CWE-119: Improper Restriction of Operations within the Bounds of a Memory Buffer (p.276)
        - B CWE-123: Write-what-where Condition (p.302)
        - B CWE-125: Out-of-bounds Read (p.308)
        - B CWE-787: Out-of-bounds Write (p.1465)
        - B CWE-824: Access of Uninitialized Pointer (p.1518)
    - C CWE-137: Representation Errors (p.1730)
      - C CWE-171: Cleansing, Canonicalization, and Comparison Errors (p.1731)
        - G CWE-707: Improper Enforcement of Message or Data Structure (p.1362)
          - G CWE-116: Improper Encoding or Escaping of Output (p.265)
          - G CWE-172: Encoding Error (p.407)
    - G CWE-185: Incorrect Regular Expression (p.436)
  - C CWE-21: Pathname Traversal and Equivalence Errors (p.1729)
    - G CWE-22: Improper Limitation of a Pathname to a Restricted Directory ('Path Traversal') (p.30)
    - B CWE-59: Improper Link Resolution Before File Access ('Link Following') (p.108)
  - C CWE-254: 7PK - Security Features (p.1734)
    - C CWE-255: Credentials Management (p.1735)
      - B CWE-640: Weak Password Recovery Mechanism for Forgotten Password (p.1252)
      - B CWE-798: Use of Hard-coded Credentials (p.1484)
    - C CWE-264: Permissions, Privileges, and Access Controls (p.1735)
      - G CWE-284: Improper Access Control (p.619)
      - G CWE-285: Improper Authorization (p.622)
      - G CWE-287: Improper Authentication (p.630)
      - V CWE-306: Missing Authentication for Critical Function (p.673)
      - B CWE-384: Session Fixation (p.838)
  - B CWE-295: Improper Certificate Validation (p.648)
    - V CWE-297: Improper Validation of Certificate with Host Mismatch (p.655)
  - C CWE-310: Cryptographic Issues (p.1738)
    - C CWE-320: Key Management Errors (p.1738)
    - G CWE-326: Inadequate Encryption Strength (p.717)
    - B CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.719)
  - G CWE-330: Use of Insufficiently Random Values (p.729)
    - B CWE-331: Insufficient Entropy (p.736)
      - V CWE-332: Insufficient Entropy in PRNG (p.738)
    - B CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) (p.748)
  - G CWE-345: Insufficient Verification of Data Authenticity (p.758)
    - B CWE-347: Improper Verification of Cryptographic Signature (p.764)
    - B CWE-352: Cross-Site Request Forgery (CSRF) (p.773)
  - B CWE-358: Improperly Implemented Security Check for Standard (p.786)
  - G CWE-693: Protection Mechanism Failure (p.1344)
    - B CWE-184: Incomplete Blacklist (p.433)
    - G CWE-20: Improper Input Validation (p.18)
      - B CWE-129: Improper Validation of Array Index (p.316)
      - V CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1194)
      - G CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (p.133)
      - B CWE-134: Use of Externally-Controlled Format String (p.339)

- C CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.140)
- B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.145)
- B CWE-88: Argument Injection or Modification (p.186)
- B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
- B CWE-91: XML Injection (aka Blind XPath Injection) (p.204)
- B CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (p.207)
- B CWE-113: Improper Neutralization of CRLF Sequences in HTTP Headers ('HTTP Response Splitting') (p.256)
- C CWE-94: Improper Control of Generation of Code ('Code Injection') (p.209)
- C CWE-943: Improper Neutralization of Special Elements in Data Query Logic (p.1621)
- B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (p.191)
- B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (p.202)
- B CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (p.230)
- B CWE-694: Use of Multiple Resources with Duplicate Identifier (p.1346)
- C CWE-361: 7PK - Time and State (p.1740)
- C CWE-362: Concurrent Execution using Shared Resource with Improper Synchronization ('Race Condition') (p.793)
- C CWE-371: State Issues (p.1741)
- B CWE-472: External Control of Assumed-Immutable Web Parameter (p.1000)
- C CWE-664: Improper Control of a Resource Through its Lifetime (p.1291)
- C CWE-610: Externally Controlled Reference to a Resource in Another Sphere (p.1212)
- C CWE-441: Unintended Proxy or Intermediary ('Confused Deputy') (p.949)
- B CWE-918: Server-Side Request Forgery (SSRF) (p.1596)
- V CWE-611: Improper Restriction of XML External Entity Reference ('XXE') (p.1214)
- C CWE-665: Improper Initialization (p.1293)
- C CWE-704: Incorrect Type Conversion or Cast (p.1358)
- C CWE-913: Improper Control of Dynamically-Managed Code Resources (p.1585)

- B CWE-434: Unrestricted Upload of File with Dangerous Type (p.934)
- V CWE-527: Exposure of CVS Repository to an Unauthorized Control Sphere (p.1096)
- V CWE-528: Exposure of Core Dump File to an Unauthorized Control Sphere (p.1097)
- V CWE-529: Exposure of Access Control List Files to an Unauthorized Control Sphere (p.1098)
- V CWE-530: Exposure of Backup File to an Unauthorized Control Sphere (p.1099)
- B CWE-538: File and Directory Information Exposure (p.1107)
- B CWE-551: Incorrect Behavior Order: Authorization Before Parsing and Canonicalization (p.1121)
- B CWE-552: Files or Directories Accessible to External Parties (p.1122)
- V CWE-566: Authorization Bypass Through User-Controlled SQL Primary Key (p.1140)
- B CWE-639: Authorization Bypass Through User-Controlled Key (p.1250)
- C CWE-642: External Control of Critical State Data (p.1256)
- V CWE-647: Use of Non-Canonical URL Paths for Authorization Decisions (p.1269)
- B CWE-653: Insufficient Compartmentalization (p.1279)
- B CWE-656: Reliance on Security Through Obscurity (p.1285)
- C CWE-668: Exposure of Resource to Wrong Sphere (p.1304)
- C CWE-669: Incorrect Resource Transfer Between Spheres (p.1306)
- C CWE-671: Lack of Administrator Control over Security (p.1309)
- C CWE-673: External Influence of Sphere Definition (p.1313)
- B CWE-708: Incorrect Ownership Assignment (p.1364)
- C CWE-732: Incorrect Permission Assignment for Critical Resource (p.1367)
- B CWE-770: Allocation of Resources Without Limits or Throttling (p.1423)
- V CWE-782: Exposed IOCTL with Insufficient Access Control (p.1453)
- B CWE-827: Improper Control of Document Type Definition (p.1524)
- C CWE-862: Missing Authorization (p.1564)
- C CWE-863: Incorrect Authorization (p.1570)
- B CWE-921: Storage of Sensitive Data in a Mechanism without Access Control (p.1599)
- C CWE-923: Improper Restriction of Communication Channel to Intended Endpoints (p.1601)
- B CWE-939: Improper Authorization in Handler for Custom URL Scheme (p.1611)
- V CWE-942: Overly Permissive Cross-domain Whitelist (p.1618)
- C CWE-1012: Cross Cutting (p.1848)
- B CWE-208: Information Exposure Through Timing Discrepancy (p.491)
- B CWE-392: Missing Report of Error Condition (p.851)
- V CWE-460: Improper Cleanup on Thrown Exception (p.980)
- B CWE-544: Missing Standardized Error Handling Mechanism (p.1114)
- B CWE-602: Client-Side Enforcement of Server-Side Security (p.1200)
- C CWE-703: Improper Check or Handling of Exceptional Conditions (p.1355)
- C CWE-754: Improper Check for Unusual or Exceptional Conditions (p.1381)

- V CWE-784: Reliance on Cookies without Validation and Integrity Checking in a Security Decision (p.1457)
- B CWE-807: Reliance on Untrusted Inputs in a Security Decision (p.1505)
- C CWE-1013: Encrypt Data (p.1849)
  - V CWE-256: Unprotected Storage of Credentials (p.565)
  - B CWE-257: Storing Passwords in a Recoverable Format (p.567)
  - V CWE-260: Password in Configuration File (p.576)
  - V CWE-261: Weak Cryptography for Passwords (p.578)
  - B CWE-311: Missing Encryption of Sensitive Data (p.685)
  - V CWE-312: Cleartext Storage of Sensitive Information (p.692)
  - V CWE-313: Cleartext Storage in a File or on Disk (p.696)
  - V CWE-314: Cleartext Storage in the Registry (p.698)
  - V CWE-315: Cleartext Storage of Sensitive Information in a Cookie (p.699)
  - V CWE-316: Cleartext Storage of Sensitive Information in Memory (p.701)
  - V CWE-317: Cleartext Storage of Sensitive Information in GUI (p.702)
  - V CWE-318: Cleartext Storage of Sensitive Information in Executable (p.703)
  - V CWE-319: Cleartext Transmission of Sensitive Information (p.705)
  - B CWE-321: Use of Hard-coded Cryptographic Key (p.708)
  - B CWE-323: Reusing a Nonce, Key Pair in Encryption (p.712)
  - B CWE-324: Use of a Key Past its Expiration Date (p.714)
  - B CWE-325: Missing Required Cryptographic Step (p.715)
  - C CWE-326: Inadequate Encryption Strength (p.717)
  - B CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.719)
  - B CWE-328: Reversible One-Way Hash (p.725)
  - C CWE-330: Use of Insufficiently Random Values (p.729)
  - B CWE-331: Insufficient Entropy (p.736)
  - V CWE-332: Insufficient Entropy in PRNG (p.738)
  - V CWE-333: Improper Handling of Insufficient Entropy in TRNG (p.740)
  - B CWE-334: Small Space of Random Values (p.741)
  - B CWE-335: Incorrect Usage of Seeds in Pseudo-Random Number Generator (PRNG) (p.743)
  - B CWE-336: Same Seed in Pseudo-Random Number Generator (PRNG) (p.745)
  - B CWE-337: Predictable Seed in Pseudo-Random Number Generator (PRNG) (p.746)
  - B CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) (p.748)
  - B CWE-339: Small Seed Space in PRNG (p.750)
  - B CWE-347: Improper Verification of Cryptographic Signature (p.764)
  - B CWE-522: Insufficiently Protected Credentials (p.1088)
  - V CWE-523: Unprotected Transport of Credentials (p.1091)
  - C CWE-757: Selection of Less-Secure Algorithm During Negotiation ('Algorithm Downgrade') (p.1392)
  - B CWE-759: Use of a One-Way Hash without a Salt (p.1395)
  - B CWE-760: Use of a One-Way Hash with a Predictable Salt (p.1400)
  - V CWE-780: Use of RSA Algorithm without OAEP (p.1449)
  - C CWE-922: Insecure Storage of Sensitive Information (p.1600)
- C CWE-1014: Identify Actors (p.1850)
  - B CWE-295: Improper Certificate Validation (p.648)
  - B CWE-296: Improper Following of a Certificate's Chain of Trust (p.652)
  - V CWE-297: Improper Validation of Certificate with Host Mismatch (p.655)
  - V CWE-298: Improper Validation of Certificate Expiration (p.658)
  - B CWE-299: Improper Check for Certificate Revocation (p.660)
  - C CWE-345: Insufficient Verification of Data Authenticity (p.758)
  - B CWE-346: Origin Validation Error (p.761)
  - V CWE-370: Missing Check for Certificate Revocation after Initial Check (p.820)
  - C CWE-441: Unintended Proxy or Intermediary ('Confused Deputy') (p.949)
  - V CWE-599: Missing Validation of OpenSSL Certificate (p.1191)
  - B CWE-940: Improper Verification of Source of a Communication Channel (p.1614)

- B CWE-941: Incorrectly Specified Destination in a Communication Channel (p.1616)
- C CWE-1015: Limit Access (p.1851)
  - V CWE-201: Information Exposure Through Sent Data (p.478)
  - B CWE-209: Information Exposure Through an Error Message (p.493)
  - B CWE-212: Improper Cross-boundary Removal of Sensitive Data (p.503)
  - V CWE-243: Creation of chroot Jail Without Changing Working Directory (p.542)
  - G CWE-250: Execution with Unnecessary Privileges (p.550)
  - G CWE-610: Externally Controlled Reference to a Resource in Another Sphere (p.1212)
  - V CWE-611: Improper Restriction of XML External Entity Reference ('XXE') (p.1214)
  - G CWE-73: External Control of File Name or Path (p.128)
- C CWE-1016: Limit Exposure (p.1852)
  - B CWE-210: Information Exposure Through Self-generated Error Message (p.499)
  - B CWE-211: Information Exposure Through Externally-Generated Error Message (p.501)
  - V CWE-214: Information Exposure Through Process Environment (p.507)
  - V CWE-550: Information Exposure Through Server Error Message (p.1120)
  - G CWE-829: Inclusion of Functionality from Untrusted Control Sphere (p.1529)
  - B CWE-830: Inclusion of Web Functionality from an Untrusted Source (p.1535)
- C CWE-1017: Lock Computer (p.1852)
  - B CWE-645: Overly Restrictive Account Lockout Mechanism (p.1266)
- C CWE-1018: Manage User Sessions (p.1853)
  - B CWE-384: Session Fixation (p.838)
  - V CWE-488: Exposure of Data Element to Wrong Session (p.1038)
  - V CWE-579: J2EE Bad Practices: Non-serializable Object Stored in Session (p.1163)
  - V CWE-6: J2EE Misconfiguration: Insufficient Session-ID Length (p.2)
  - B CWE-613: Insufficient Session Expiration (p.1218)
  - B CWE-841: Improper Enforcement of Behavioral Workflow (p.1556)
- C CWE-1019: Validate Inputs (p.1853)
  - G CWE-138: Improper Neutralization of Special Elements (p.347)
  - V CWE-150: Improper Neutralization of Escape, Meta, or Control Sequences (p.368)
  - G CWE-20: Improper Input Validation (p.18)
  - B CWE-349: Acceptance of Extraneous Untrusted Data With Trusted Data (p.768)
  - B CWE-352: Cross-Site Request Forgery (CSRF) (p.773)
  - B CWE-472: External Control of Assumed-Immutable Web Parameter (p.1000)
  - V CWE-473: PHP External Variable Modification (p.1004)
  - V CWE-502: Deserialization of Untrusted Data (p.1069)
  - B CWE-59: Improper Link Resolution Before File Access ('Link Following') (p.108)
  - V CWE-601: URL Redirection to Untrusted Site ('Open Redirect') (p.1194)
  - B CWE-641: Improper Restriction of Names for Files and Other Resources (p.1255)
  - B CWE-643: Improper Neutralization of Data within XPath Expressions ('XPath Injection') (p.1262)
  - B CWE-652: Improper Neutralization of Data within XQuery Expressions ('XQuery Injection') (p.1277)
  - G CWE-74: Improper Neutralization of Special Elements in Output Used by a Downstream Component ('Injection') (p.133)
  - G CWE-75: Failure to Sanitize Special Elements into a Different Plane (Special Element Injection) (p.137)
  - B CWE-76: Improper Neutralization of Equivalent Special Elements (p.138)
  - G CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (p.140)
  - B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.145)
  - B CWE-79: Improper Neutralization of Input During Web Page Generation ('Cross-site Scripting') (p.156)
  - G CWE-790: Improper Filtering of Special Elements (p.1473)
  - B CWE-791: Incomplete Filtering of Special Elements (p.1475)
  - V CWE-792: Incomplete Filtering of One or More Instances of Special Elements (p.1476)
  - V CWE-793: Only Filtering One Instance of a Special Element (p.1477)
  - V CWE-794: Incomplete Filtering of Multiple Instances of Special Elements (p.1479)

- B CWE-795: Only Filtering Special Elements at a Specified Location (*p.1480*)
- V CWE-796: Only Filtering Special Elements Relative to a Marker (*p.1481*)
- V CWE-797: Only Filtering Special Elements at an Absolute Position (*p.1483*)
- B CWE-88: Argument Injection or Modification (*p.186*)
- B CWE-89: Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection') (*p.191*)
- B CWE-90: Improper Neutralization of Special Elements used in an LDAP Query ('LDAP Injection') (*p.202*)
- B CWE-91: XML Injection (aka Blind XPath Injection) (*p.204*)
- B CWE-93: Improper Neutralization of CRLF Sequences ('CRLF Injection') (*p.207*)
- G CWE-94: Improper Control of Generation of Code ('Code Injection') (*p.209*)
- G CWE-943: Improper Neutralization of Special Elements in Data Query Logic (*p.1621*)
- B CWE-95: Improper Neutralization of Directives in Dynamically Evaluated Code ('Eval Injection') (*p.214*)
- B CWE-96: Improper Neutralization of Directives in Statically Saved Code ('Static Code Injection') (*p.218*)
- V CWE-97: Improper Neutralization of Server-Side Includes (SSI) Within a Web Page (*p.222*)
- B CWE-98: Improper Control of Filename for Include/Require Statement in PHP Program ('PHP Remote File Inclusion') (*p.223*)
- B CWE-99: Improper Control of Resource Identifiers ('Resource Injection') (*p.230*)
- C CWE-1020: Verify Message Integrity (*p.1855*)
- B CWE-353: Missing Support for Integrity Check (*p.780*)
- B CWE-354: Improper Validation of Integrity Check Value (*p.782*)
- G CWE-390: Detection of Error Condition Without Action (*p.844*)
- B CWE-391: Unchecked Error Condition (*p.849*)
- B CWE-494: Download of Code Without Integrity Check (*p.1052*)
- B CWE-565: Reliance on Cookies without Validation and Integrity Checking (*p.1138*)
- B CWE-649: Reliance on Obfuscation or Encryption of Security-Relevant Inputs without Integrity Checking (*p.1273*)
- G CWE-707: Improper Enforcement of Message or Data Structure (*p.1362*)
- G CWE-755: Improper Handling of Exceptional Conditions (*p.1389*)
- G CWE-924: Improper Enforcement of Message Integrity During Transmission in a Communication Channel (*p.1603*)

## Graph View: CWE-1026: Weaknesses in OWASP Top Ten (2017)

- C** CWE-1027: OWASP Top Ten 2017 Category A1 - Injection (*p.1856*)
  - G** CWE-77: Improper Neutralization of Special Elements used in a Command ('Command Injection') (*p.140*)

  - B CWE-459: Incomplete Cleanup (p.978)
  - B CWE-772: Missing Release of Resource after Effective Lifetime (p.1432)
  - V CWE-773: Missing Reference to Active File Descriptor or Handle (p.1437)
  - V CWE-775: Missing Release of File Descriptor or Handle after Effective Lifetime (p.1439)
  - B CWE-771: Missing Reference to Active Allocated Resource (p.1430)
  - B CWE-910: Use of Expired File Descriptor (p.1581)
  - B CWE-666: Operation on Resource in Wrong Phase of Lifetime (p.1298)
  - B CWE-672: Operation on a Resource after Expiration or Release (p.1310)
  - G CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1393)
  - V CWE-686: Function Call With Incorrect Argument Type (p.1334)
  - V CWE-685: Function Call With Incorrect Number of Arguments (p.1333)
- C CWE-1165: SEI CERT C Coding Standard - Guidelines 10. Environment (ENV) (p.1880)
  - G CWE-705: Incorrect Control Flow Scoping (p.1359)
  - B CWE-676: Use of Potentially Dangerous Function (p.1317)
  - B CWE-78: Improper Neutralization of Special Elements used in an OS Command ('OS Command Injection') (p.145)
  - B CWE-88: Argument Injection or Modification (p.186)
- C CWE-1166: SEI CERT C Coding Standard - Guidelines 11. Signals (SIG) (p.1881)
  - V CWE-479: Signal Handler Use of a Non-reentrant Function (p.1019)
  - B CWE-662: Improper Synchronization (p.1288)
- C CWE-1167: SEI CERT C Coding Standard - Guidelines 12. Error Handling (ERR) (p.1881)
  - B CWE-456: Missing Initialization of a Variable (p.971)

- B CWE-391: Unchecked Error Condition (p.849)
- B CWE-252: Unchecked Return Value (p.556)
- B CWE-253: Incorrect Check of Function Return Value (p.563)
- B CWE-676: Use of Potentially Dangerous Function (p.1317)
- C CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1393)
- C CWE-1168: SEI CERT C Coding Standard - Guidelines 13. Application Programming Interfaces (API) (p.1882)
- C CWE-1169: SEI CERT C Coding Standard - Guidelines 14. Concurrency (CON) (p.1882)
  - B CWE-667: Improper Locking (p.1300)
  - B CWE-366: Race Condition within a Thread (p.809)
  - B CWE-676: Use of Potentially Dangerous Function (p.1317)
  - C CWE-330: Use of Insufficiently Random Values (p.729)
  - B CWE-377: Insecure Temporary File (p.828)
- C CWE-1170: SEI CERT C Coding Standard - Guidelines 48. Miscellaneous (MSC) (p.1883)
  - B CWE-327: Use of a Broken or Risky Cryptographic Algorithm (p.719)
  - C CWE-330: Use of Insufficiently Random Values (p.729)
  - B CWE-338: Use of Cryptographically Weak Pseudo-Random Number Generator (PRNG) (p.748)
  - B CWE-676: Use of Potentially Dangerous Function (p.1317)
  - B CWE-331: Insufficient Entropy (p.736)
  - C CWE-758: Reliance on Undefined, Unspecified, or Implementation-Defined Behavior (p.1393)
- C CWE-1171: SEI CERT C Coding Standard - Guidelines 50. POSIX (POS) (p.1883)
  - B CWE-170: Improper Null Termination (p.403)
  - B CWE-242: Use of Inherently Dangerous Function (p.540)
  - B CWE-363: Race Condition Enabling Link Following (p.800)
  - C CWE-696: Incorrect Behavior Order (p.1349)
  - B CWE-273: Improper Check for Dropped Privileges (p.602)
  - B CWE-667: Improper Locking (p.1300)
  - B CWE-391: Unchecked Error Condition (p.849)
  - B CWE-252: Unchecked Return Value (p.556)
  - B CWE-253: Incorrect Check of Function Return Value (p.563)
- C CWE-1172: SEI CERT C Coding Standard - Guidelines 51. Microsoft Windows (WIN) (p.1884)
  - V CWE-762: Mismatched Memory Management Routines (p.1406)
  - C CWE-227: 7PK - API Abuse (p.1732)
  - V CWE-590: Free of Memory not on the Heap (p.1178)

## Deprecated

---

### CWE-1: DEPRECATED: Location

CWE ID : 1

Status: Deprecated

#### Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

### CWE-3: DEPRECATED: Technology-specific Environment Issues

CWE ID : 3

Status: Deprecated

#### Summary

This category has been deprecated. It was originally intended as a "catch-all" for environment issues for technologies that did not have their own CWE, but it introduced unnecessary depth and complexity to the Development View (CWE-699).

---

### CWE-10: DEPRECATED: ASP.NET Environment Issues

CWE ID : 10

Status: Deprecated

#### Summary

This category has been deprecated. It added unnecessary depth and complexity to its associated views.

---

### CWE-60: DEPRECATED: UNIX Path Link Problems

CWE ID : 60

Status: Deprecated

#### Summary

This category has been deprecated. It covered a very low level of abstraction based on operating system, which was not useful for any existing view.

---

### CWE-63: DEPRECATED: Windows Path Link Problems

CWE ID : 63

Status: Deprecated

#### Summary

This category has been deprecated. It covered a very low level of abstraction based on operating system, which was not useful for any existing view.

---

### CWE-68: DEPRECATED: Windows Virtual File Problems

2020

---

CWE ID : 68

Status: Deprecated

### Summary

This category has been deprecated as it was found to be an unnecessary abstraction of platform specific details. Please refer to the category CWE-632 and weakness CWE-66 for relevant relationships.

---

## CWE-70: DEPRECATED: Mac Virtual File Problems

---

CWE ID : 70

Status: Deprecated

### Summary

This category has been deprecated as it was found to be an unnecessary abstraction of platform specific details. Please refer to the category CWE-632 and weakness CWE-66 for relevant relationships.

---

## CWE-71: DEPRECATED: Apple '.DS\_Store'

---

CWE ID : 71

Status: Deprecated

### Description

This entry has been deprecated as it represents a specific observed example of a UNIX Hard Link weakness type rather than its own individual weakness type. Please refer to CWE-62.

---

## CWE-92: DEPRECATED: Improper Sanitization of Custom Special Characters

---

CWE ID : 92

Status: Deprecated

### Description

This entry has been deprecated. It originally came from PLOVER, which sometimes defined "other" and "miscellaneous" categories in order to satisfy exhaustiveness requirements for taxonomies. Within the context of CWE, the use of a more abstract entry is preferred in mapping situations. CWE-75 is a more appropriate mapping.

---

## CWE-100: DEPRECATED: Technology-Specific Input Validation Problems

---

CWE ID : 100

Status: Deprecated

### Summary

This category has been deprecated. It was originally intended as a "catch-all" for input validation problems in technologies that did not have their own CWE, but introduces unnecessary depth to the hierarchy.

---

## CWE-101: DEPRECATED: Struts Validation Problems

---

CWE ID : 101

Status: Deprecated

## Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-69 9), but it introduced unnecessary complexity and depth to the resulting tree.

---

## **CWE-132: DEPRECATED (Duplicate): Miscalculated Null Termination**

CWE ID : 132

Status: Deprecated

## Description

This entry has been deprecated because it was a duplicate of CWE-170. All content has been transferred to CWE-170.

---

## **CWE-139: DEPRECATED: General Special Element Problems**

CWE ID : 139

Status: Deprecated

## Summary

This entry has been deprecated. It is a leftover from PLOVER, but CWE-138 is a more appropriate mapping.

---

## **CWE-169: DEPRECATED: Technology-Specific Special Elements**

CWE ID : 169

Status: Deprecated

## Summary

This category has been deprecated. It was originally intended as a "catch-all" for input validation problems in technologies that did not have their own CWE, but introduces unnecessary depth to the hierarchy.

---

## **CWE-217: DEPRECATED: Failure to Protect Stored Data from Modification**

CWE ID : 217

Status: Deprecated

## Description

This weakness has been deprecated because it incorporated and confused multiple weaknesses. The issues formerly covered in this weakness can be found at CWE-766 and CWE-767.

---

## **CWE-218: DEPRECATED (Duplicate): Failure to provide confidentiality for stored data**

CWE ID : 218

Status: Deprecated

## Description

This weakness has been deprecated because it was a duplicate of CWE-493. All content has been transferred to CWE-493.

---

## **CWE-225: DEPRECATED (Duplicate): General Information Management Problems**

CWE ID : 225

Status: Deprecated

### **Description**

This weakness can be found at CWE-199.

---

## **CWE-247: DEPRECATED (Duplicate): Reliance on DNS Lookups in a Security Decision**

CWE ID : 247

Status: Deprecated

### **Description**

This entry has been deprecated because it was a duplicate of CWE-350. All content has been transferred to CWE-350.

---

## **CWE-249: DEPRECATED: Often Misused: Path Manipulation**

CWE ID : 249

Status: Deprecated

### **Description**

This entry has been deprecated because of name confusion and an accidental combination of multiple weaknesses. Most of its content has been transferred to CWE-785.

---

## **CWE-292: DEPRECATED (Duplicate): Trusting Self-reported DNS Name**

CWE ID : 292

Status: Deprecated

### **Description**

This entry has been deprecated because it was a duplicate of CWE-350. All content has been transferred to CWE-350.

---

## **CWE-373: DEPRECATED: State Synchronization Error**

CWE ID : 373

Status: Deprecated

### **Description**

This entry was deprecated because it overlapped the same concepts as race condition (CWE-362) and Improper Synchronization (CWE-662).

## CWE-418: DEPRECATED: Channel Errors

CWE ID : 418

Status: Deprecated

### Summary

This category has been deprecated because it is redundant with the grouping provided by CWE-417.

---

## CWE-423: DEPRECATED (Duplicate): Proxied Trusted Channel

CWE ID : 423

Status: Deprecated

### Description

This entry has been deprecated because it was a duplicate of CWE-441. All content has been transferred to CWE-441.

---

## CWE-443: DEPRECATED (Duplicate): HTTP response splitting

CWE ID : 443

Status: Deprecated

### Description

This weakness can be found at CWE-113.

---

## CWE-445: DEPRECATED: User Interface Errors

CWE ID : 445

Status: Deprecated

### Summary

This weakness has been deprecated because it was a duplicate of CWE-355. All content has been transferred to CWE-355.

---

## CWE-458: DEPRECATED: Incorrect Initialization

CWE ID : 458

Status: Deprecated

### Description

This weakness has been deprecated because its name and description did not match. The description duplicated CWE-454, while the name suggested a more abstract initialization problem. Please refer to CWE-665 for the more abstract problem.

---

## CWE-503: DEPRECATED: Byte/Object Code

CWE ID : 503

Status: Deprecated

### Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

---

## CWE-504: DEPRECATED: Motivation/Intent

CWE ID : 504

Status: Deprecated

### Summary

This category has been deprecated. It was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

---

## CWE-505: DEPRECATED: Intentionally Introduced Weakness

CWE ID : 505

Status: Deprecated

### Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

---

## CWE-513: DEPRECATED: Intentionally Introduced Nonmalicious Weakness

CWE ID : 513

Status: Deprecated

### Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

---

## CWE-516: DEPRECATED (Duplicate): Covert Timing Channel

CWE ID : 516

Status: Deprecated

### Description

This weakness can be found at CWE-385.

---

---

## CWE-517: DEPRECATED: Other Intentional, Nonmalicious Weakness

CWE ID : 517

Status: Deprecated

### Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

---

## CWE-518: DEPRECATED: Inadvertently Introduced Weakness

CWE ID : 518

Status: Deprecated

### Summary

This category has been deprecated as it was originally used for organizing the Development View (CWE-699), but it introduced unnecessary complexity and depth to the resulting tree.

---

### **CWE-533: DEPRECATED: Information Exposure Through Server Log Files**

CWE ID : 533

Status: Deprecated

#### **Description**

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

---

### **CWE-534: DEPRECATED: Information Exposure Through Debug Log Files**

CWE ID : 534

Status: Deprecated

#### **Description**

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

---

### **CWE-542: DEPRECATED: Information Exposure Through Cleanup Log Files**

CWE ID : 542

Status: Deprecated

#### **Description**

This entry has been deprecated because its abstraction was too low-level. See CWE-532.

---

### **CWE-545: DEPRECATED: Use of Dynamic Class Loading**

CWE ID : 545

Status: Deprecated

#### **Description**

This weakness has been deprecated because it partially overlaps CWE-470, it describes legitimate programmer behavior, and other portions will need to be integrated into other entries.

---

### **CWE-592: DEPRECATED: Authentication Bypass Issues**

CWE ID : 592

Status: Deprecated

#### **Description**

This weakness has been deprecated because it covered redundant concepts already described in CWE-287.

---

### **CWE-596: DEPRECATED: Incorrect Semantic Object Comparison**

CWE ID : 596

Status: Deprecated

#### **Description**

This weakness has been deprecated. It was poorly described and difficult to distinguish from other entries. It was also inappropriate to assign a separate ID solely because of domain-specific considerations. Its closest equivalent is CWE-1023.

---

---

## CWE-630: DEPRECATED: Weaknesses Examined by SAMATE

CWE ID : 630

Status: Deprecated

### Objective

This view has been deprecated. It was only used for an early year of the NIST SAMATE project, and it did not represent any official or commonly-utilized list.

---

## CWE-631: DEPRECATED: Resource-specific Weaknesses

CWE ID : 631

Status: Deprecated

### Objective

This view has been deprecated because it is not actively maintained and does not provide utility to stakeholders. It was originally created before CWE 1.0 as a simple example of how views could be structured within CWE.

---

## CWE-632: DEPRECATED: Weaknesses that Affect Files or Directories

CWE ID : 632

Status: Deprecated

### Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

---

## CWE-633: DEPRECATED: Weaknesses that Affect Memory

CWE ID : 633

Status: Deprecated

### Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

---

## CWE-634: DEPRECATED: Weaknesses that Affect System Processes

CWE ID : 634

Status: Deprecated

### Summary

This category has been deprecated. It was not actively maintained, and it was not useful to stakeholders. It was originally created before CWE 1.0 as part of view CWE-631, which was a simple example of how views could be structured within CWE.

---

## CWE-679: DEPRECATED: Chain Elements

CWE ID : 679

Status: Deprecated

---

### Objective

This view has been deprecated. It has limited utility for stakeholders, since all weaknesses can be links in a chain.

---

## **CWE-769: DEPRECATED: Uncontrolled File Descriptor Consumption**

**CWE ID :** 769

**Status:** Deprecated

### Description

This entry has been deprecated because it was a duplicate of CWE-774. All content has been transferred to CWE-774.

---

## Glossary

---

# Index

## A

Absolute Path Traversal, 70  
 Acceptance of Extraneous Untrusted Data With Trusted Data, 768  
 Access of Memory Location After End of Buffer, 1466  
 Access of Memory Location Before Start of Buffer, 1462  
 Access of Resource Using Incompatible Type ('Type Confusion'), 1561  
 Access of Uninitialized Pointer, 1518  
 Access to Critical Private Variable via Public Method, 1419  
 Addition of Data Structure Sentinel, 986  
 Algorithmic Complexity, 885  
 Allocation of File Descriptors or Handles Without Limits or Throttling, 1438  
 Allocation of Resources Without Limits or Throttling, 1423  
 Always-Incorrect Control Flow Implementation, 1308  
 Architectural Concepts, 1911(*Graph: 2005*)  
 Architecture with Number of Horizontal Layers Outside of Expected Range, 1644  
 Argument Injection or Modification, 186  
 Array Declared Public, Final, and Static, 1167  
 ASP.NET Misconfiguration: Creating Debug Binary, 9  
 ASP.NET Misconfiguration: Improper Model Validation, 1723  
 ASP.NET Misconfiguration: Missing Custom Error Page, 10  
 ASP.NET Misconfiguration: Not Using Input Validation Framework, 1125  
 ASP.NET Misconfiguration: Password in Configuration File, 12  
 ASP.NET Misconfiguration: Use of Identity Impersonation, 1127  
 Assigning instead of Comparing, 1024  
 Assignment of a Fixed Address to a Pointer, 1174  
 Assignment to Variable without Use, 1135  
 Asymmetric Resource Consumption (Amplification), 881  
 Attempt to Access Child of a Non-structure Pointer, 1176  
 Audit, 1844  
 Authenticate Actors, 1845  
 Authentication Bypass by Alternate Name, 638  
 Authentication Bypass by Assumed-Immutable Data, 667  
 Authentication Bypass by Capture-replay, 647  
 Authentication Bypass by Primary Weakness, 672  
 Authentication Bypass by Spoofing, 640  
 Authentication Bypass Using an Alternate Path or Channel, 636  
 Authentication Bypass: OpenSSL CTX Object Modified after SSL Objects are Created, 1182  
 Authorization Bypass Through User-Controlled Key, 1250  
 Authorization Bypass Through User-Controlled SQL Primary Key, 1140  
 Authorize Actors, 1846  
 Automated Recognition Mechanism with Inadequate Detection or Handling of Adversarial Input Perturbations, 1639

## B

Bad Coding Practices, 1843  
 Behavioral Change in New Version or Environment, 947  
 Behavioral Problems, 1747  
 Buffer Access Using Size of Source Buffer, 1501  
 Buffer Access with Incorrect Length Value, 1495  
 Buffer Copy without Checking Size of Input ('Classic Buffer Overflow'), 286  
 Buffer Over-read, 310  
 Buffer Under-read, 313  
 Buffer Underwrite ('Buffer Underflow'), 304

Business Logic Errors, 1783

  - Use of Non-Canonical URL Paths for Authorization Decisions, 1269
  - Use of NullPointerException Catch to Detect NULL Pointer Dereference, 856
  - Use of Object without Invoking Destructor Method, 1689
  - Use of Obsolete Function, 1013
  - Use of Out-of-range Pointer Offset, 1515
  - Use of Password Hash Instead of Password for Authentication, 1546
  - Use of Password Hash With Insufficient Computational Effort, 1591
  - Use of Password System for Primary Authentication, 683
  - Use of Path Manipulation Function without Maximum-sized Buffer, 1460
  - Use of Platform-Dependent Third Party Components, 1701
  - Use of Pointer Subtraction to Determine Size, 993
  - Use of Potentially Dangerous Function, 1317
  - Use of Prohibited Code, 1724
  - Use of Redundant Code, 1641
  - Use of RSA Algorithm without OAEP, 1449
  - Use of Same Invokable Control Element in Multiple Architectural Layers, 1690
  - Use of Same Variable for Multiple Purposes, 1705
  - Use of Single-factor Authentication, 681
  - Use of Singleton Pattern Without Synchronization in a Multithreaded Context, 1113

Use of sizeof() on a Pointer Type, 989  
Use of umask() with chmod-style Argument, 1129  
Use of Uninitialized Resource, 1575  
Use of Uninitialized Variable, 974  
Use of Unmaintained Third Party Components, 1701  
Use of Web Link to Untrusted Target with window.opener  
Access, 1630  
Use of Wrong Operator in String Comparison, 1188  
User Interface (UI) Misrepresentation of Critical  
Information, 961  
User Interface Security Issues, 1739  
Using Referer Field for Authentication, 645
